Perle IRG7000/5000 5G/LTE Cellular Router Command Line Interface Reference Guide

www.perle.com

Table of Contents

Preface

About This Book

This guide provides the information you need to:

- configure the Perle Router using the Command Line Interface (CLI)
- Some CLI commands are not available, on some models

Intended Audience

This guide is for administrators who will be configuring the Perle Router, hereafter known as the router.

Some prerequisite knowledge is needed to understand the concepts and examples in this guide:

- If you are using an external authentication application(s), working knowledge of the authentication application(s).
- Knowledge of the file transfer protocols the router uses.

Typeface Conventions

Most text is presented in the typeface used in this paragraph. Other typefaces are used to help you identify certain types of information.
The other typefaces are:

Typeface Example	Usage
clear {**[ip dhcp binding]**}	Commands are in bold blue text and keywords for those command use bold green text.
<WORD>	Arguments in which you supply the values are in purple italics.
username [nopassword] | **[privilege 1]** | **15]** | **[secret 0** *<cleartext-password>***]** | **[5** *<hidden-user-secret>* | *<cleartext-password>***]**	Square brackets means optional elements, but not required to complete the command. Such as command username does not require nopassword, privilege or secret for completion. Vertical bars within this example separate alternative choices and can be viewed as an or between parameters.
snmp-server {**contact** *<contact-name>*}	Curly braces surround the entire keyword/ optional commands.
Perle IRG7000/5000 5G/LTE Router Series, User's Guide	This typeface indicates a book or document title.
See *About This Book* for more information.	This indicates a cross-reference to another chapter or section that you can click on to jump to that section.

Setting up the Router

For information on how to set up your router for the first time, see the Hardware Installation Guide (HIG) or User's Guide for your product. These are available on the Perle Web site at https://www.perle.com/downloads/.

① Using the Command-Line Interface

This book provides the command line interface (CLI) options available for the Perle router. This chapter describes how to use the command-line interface (CLI) to configure software features. Commands are grouped by Command modes. Some CLI commands may not be applicable to your model or running software.

Command Modes

Command Mode	Prompt	Exit Mode	Access Next Mode
User EXEC mode	Perle>	**logout** command	**enable** command
Privileged EXEC mode	Perle#	**disable** command	**configure** command
Global configuration mode	Perle(config)#	**end** or **exit** command	**interface** command
Interface configuration mode	Perle(config-if)# Perle(config-if-range)#	**end** command	**interface** command, interface type, interface number
Line configuration mode	Perle(config-line)#	**end** command	**interface** command, interface type, interface number

Each command is broken down into several categories:

- **Description**—Provides a brief explanation of how the command is used.
- **Syntax**—Shows the actual command line options. The options can be typed in any order on the command line. The syntax explanation will use the following command to break down the command syntax:

```
For example: telnet 172.16.4.92
This command opens a telnet session to the host with the
IP address of 172.16.4.92. If you use a name rather than
an IP address, you can use the /ipv4 option to force the
connection to use an IPv4 format for the network address.

For example: sdm [default|dual-ipv4-and-ipv6]
This command sdm has an option of either default or dual
ipv4 and ipv6. You can choose either option but not both.
```

Braces ({}) group required choices and vertical bars (|) separate the alternative choices. Square brackets ([]) show the options that are available for the command. You can type a command with each option individually, or string options together in any order you want. Brace and vertical bars within square brackets {[]} means requires a choice within and optional element. The pipe (|) within a square bracket means a choice between the elements.

For example, valid values for (config)#ip **{**community-list **[**expanded | standard**]}**. Valid values are expanded or standard but you cannot select both at the same time.

- **Options**—Provides an explanation of each of the options for a command and the default value if there is one. Some commands do not have any options, so this category is absent.
- **UP arrow**—show a history of the previous commands entered.

Command Shortcuts

When you type a command, you can specify the shortest unique version of that command or you can press the **TAB** key to complete the command. For example, the following command:

```
Perle(config)#service dhcp
```

can be typed as:

```
Perle(config)#se d
```

or, you can use the **TAB** key to complete the lines as you go along:

se<**TAB**>d<**TAB**>

where the **TAB** key was pressed to complete the option as it was typed.

Command Options

When you are typing commands on the command line (while connected to the router, you can view the options by typing a question mark (**?**), after any part of the command to see what options are available/valid. For example:

Perle#terminal ?

```
help
history
length
monitor
no
width
```

Common Commands

default

Use the default command to set a command back to it's defaults.

disable

Use the disable command to de-elevate from Privilege EXEC mode to User Exec mode.

do-exec

Run exec commands while in config mode.

enable

Use the enable command to elevate to Privilege EXEC mode from User Exec mode.

exit

The exit command in User EXEC mode logs you out of the router. In command mode it takes you to down one level of authority.

help

The help command gives you full help or partial help depending on your needs.

Usage Guidelines

Help may be requested at any point in a command by entering a question mark '?'. If nothing matches, the help list is empty and you must backup until entering a '?' shows available options.

Two styles of help are provided:

1. Full help is available when you are ready to enter a command argument (e.g. show ?.)

2. Partial help is provided when an abbreviated argument and you want to know what arguments match the input (e.g. 'show pr?'.)

login

Log into the router.

logout

Log out of the router.

no

Use the no command to negate a command.

Perle> ?

- The ">" indicates that the current mode is "User EXEC"

User Exec Mode

clear	Reset functions
enable	Switch to privilege mode
exit	Exit from EXEC
help	Description of the interactive help
line-attach	Attach to a configured terminal line
logout	Logout of current user
password	Change your password
ping	Send echo messages
release	Release a resource
renew	Renew a resource
show	Display internal settings
ssh	Open a secure shell client connection
telnet	Open a telnet connection
terminal	Set terminal characteristics
testemail	Send a test email message
traceroute	Trace route to destination
two-factor	Change two factor settings

Example:
>clear ip dhcp binding *

Perle# ?
- The "#" indicates that the current mode is "Priviliged EXEC"

Privilege EXEC Mode

archive	Manage archive files
boot	Modify system boot parameters
cd	Change current directory
cellular	Cellular commands
clear	Reset functions
clock	Manage system clock
configure	Switch to (config)#
container (OCI)	Container operational commands
copy	Copy from one file to another
debug	Debugging functions (see also 'undebug')
delete	Delete files
dir	List files on a file system
disable	Leave privileged mode
disconnect	Disconnect an existing network connection
dot1x	IEEE 802.1X Exec commands
exit	Exit from the EXEC
help	Description of interactive help
kill	Reset the serial line
line-attach	Attach to a configured terminal line
logout	Logout of current user
mkdir	Create a new directory
more	Display the contents of a file
no	Negate a command or set to defaults
password	Change your password
ping	Send echo messages
pwd	Display present working directory
release	Release a resource

reload	Reboot the router
rename	Rename a file
renew	Renew a DHCP lease
reset	Reset commands
rmdir	Remove a directoy
serialt	Take a serial trace
show	Display internal settings
shutdown	Shut down the router
ssh	Open a secure shell client connection
standby	Power standby mode operations
telnet	Open a telnet connection
terminal	Set terminal characteristics
testemail	Send a test email message
testsms	Send a test SMS message
traceroute	Trace route to destination
two-factor	Change your two factor settings
undebug	Disable debugging function (also see 'debug')
vrrp	VRRP commands

Example:
Perle(config)#hostname TESTLAB<cr>
TESTLAB(config)#

Global Configuration Mode

aaa	Authentication, Authorization and Accounting
alarm	Environmental facilities
archive	Archive software and configuration commands
arp	Set ARP options or static entry
banner	Define a login banner
boot	Modify system boot parameters
bridge	Bridge group and spanning-tree logging
cellular	Cellular commands
class-map	Configure class map
clock	Configure time-of-day clock
container (OCI)	Configure container (OCI) applications
container management (OCI)	Configure container (OCI) management
controller	Configure a specific controller
crypto	Encryption operations
default	Set a command to its default
do-exec	Run exec command in config mode
dot11	IEEE 802.11 WLAN
dot1x	IEEE 802.1X global configuration commands
eap	EAP global configure commands
email	Email notifications configuration
enable	Set enable password
end	End the config session
exit	Exit config mode
gnss	GNSS configuration
help	Description of interactive help
hostname	Set system's network name
interface	Select an interface
ip	Global configuration commands

ipv6	Global IPv6 configuration commands
key	Key management
ldap	LDAP server configuration command
line	Configure a terminal line
lldp	Global LLDP configuration subcommands
logging	Set logging
login	Login configuration
low-power-mode	Low power mode configuration
mac	Global MAC configuration subcommands
management-access	Management access commands
nat66	NAT66 interface commands
network-watchdog	Configure network watchdog
no	Negate a command or set its default
ntp	Configure NTP
policy-map	Configure policy map
power	Configure power parameters
radius	RADIUS configuration
radius-server	RADIUS server configuration
remote-management	Configure remote management/RESTful API
route-map	Create route map or enter route map mode
router	Enable a routing process
sdm	Configure system network profile (enable IPv6)
serial	Serial commands
service	Network based services configuration
snmp-server	Enable SNMP, modify SNMP engine parameters
standby	Configure power management standby
tacacs	TACACS+ configuration
tacacs-server	TACACS+ server configuration
tty	Configure terminal controller

usb	Configure USB parameters
username	Configure user name authentication
wan	Configure WAN management
zone	Firewall with zoning
zone-pair	Zone pair firewall

Perle#configure
Configuring from terminal
Perle(config)#
Perle(config)#interface eth 1
Perle(config-if)#

Show Command Filtering and Redirection

The router's CLI command prompt provides you ways of searching through large amounts of show/more output and then filtering the output according to parameters (regular expressions) that you supply on the command line. This allows you to filter on patterns such as a phrase, number, or more complex patterns.

A regular expression can be a single-character pattern or a multiple-character pattern. That is, a regular expression can be a single character that matches the same single character in the command output or multiple characters that match the same multiple characters in the command output. The pattern in the command output is referred to as *<LINE>*. This section describes creating both single-character patterns and multiple-character patterns.

[begin | count | exclude | include} *<LINE>* |
    section [exclude | include] *<LINE>* |
    format json |
    redirect flash: *<file-name>* |
        ftp://[[username:password@]{hostname | host-ip}/directory]/<filename> |
        http://[[username:password]@]{hostname | host-ip}/ [directory]/<filename> |
        http://[[username:password]@]{hostname | host-ip}/ [directory]/<filename> |
        nvram:<file-name> |
        scp://[[username:password@location]/directory]/<filename> |
        sftp://[[//username:password]@location]/directory]/<filename> |
        tftp://[{hostname | host-ip}/ [directory]/<filename> |
    append flash: *<file-name>* | **nvram:**<file-name> |
    tee /append]flash:<file-name> |
        ftp://[[username:password@]{hostname | host-ip}/directory]/<filename> |
        http://[[username:password]@]{hostname | host-ip}/ [directory]/<filename> |
        http://[[username:password]@]{hostname | host-ip}/ [directory]/<filename> |
        nvram:<file-name> |
        scp://[[username:password@location]/directory]/<filename> |

sftp://[[///username:password]@location]/directory]/<filename> |

tftp://[{hostname | host-ip}/ [directory]/<filename>}

Output Modifiers

append	Appends redirected output to the specified flash: or nvram: filename.
begin	Begin unfiltered output with the first line that contains the regular expression and every line there after.
count	Displays a count of the number of occurrences of the regular expression.
exclude	Display output lines that do not contain the regular expression.
format	Format the output using the specified format.
include	Display output line that contain the regular expression.
redirect	Redirect output to specified URL and file name. The file is created or overwrites it if it already exists.
section	Displays output lines that contain the regular expression as well as any lines associated, (any lines immediately following the line that contains the regular expression).
tee	Display the output on-screen while being redirected or appended to the specified URL and file name.
line	This is a regular expression that is used to filter the output. A regular expression is a pattern (a phrase, number, or more complex pattern) that the router's CLI command uses to match against show or more command output. Regular expressions are case-sensitive and allow for simple matching requirements such as "include" entries like "serial or 138".

Single-Character Patterns

The simplest regular expression is a single character that matches the same single character in the command output.
You can use any letter

- (A-Z, a-z)
- or digits (0-9)
- or characters such as ! or ~

Certain key board characters have special meaning using in regular expressins.The table below lists the keyboard character that have special meaning.

Character	Special Meaning
.	Match any single character, including white space.
*	Matches 0 or more sequences of the pattern.
+	Displays output lines that do not contain the regular expression.

?	Matches 0 or 1 occurrences of the pattern. Use <ctl-v) if you need to enter a "?".
^	Matches the beginning of the string.
$	Redirect output to specified URL and file name. The file is created or overwrites it if it already exists.
_ (underscore)	Matches a comma (,), left brace ({), right brace (}), right parenthesis ()), left parenthesis ((), the beginning of the string, the end of the string, or a space.

To use these special characters as single-character patterns, you must remove the special meaning by preceding each character with a backslash (\).
For example:
\$ = $ (dollar sign)
_ = _ (underscore)
\+ = + (plus symbol

You can also specify a range of single-character matches against the command output by placing the square brackets around the characters to be matched.
For example:
[abcd] or simply [a-d]

You can include a left square bracket ([) as a single-character pattern in your range, by preceding the ([) with a backslash. The following example match son character a-d and ([)
For example:
[a-d\[]

You can reverse the matching of the range by including a caret (^) at the start of the range. The following example matches any letter except the ones listed.
For example:
[^a-dqsk]

Multiple-Character Patterns
When creating regular expressions, you can also specify a pattern containing multiple characters. You create multiple-character regular expressions by joining letters, digits, or keyboard characters that do not have special meaning.
For example:
a4% = a multiple-character regular expression.
Note: Insert a backslash before the keyboard characters that have special meaning when you want to indicate that the character should be interpreted literally.
\$ = $ (dollar sign)
_ = _ (underscore)
\+ = + (plus symbol

Order is important with multiple-character patterns. The regular expression b5! matches the character b followed by a 5 followed by a ! symbol. If the string does not have b5!, in that order, pattern matching fails.

In this example the multiple-character regular expression b.uses the special meaning of the period character to match the letter a followed by any single character. The use of (.) period character within a multiple-character expression has a special meaning in that any character matching after the initial character is deemed a match.
For example:
b. = matches bb, b!, b2

Note: You can remove the special meaning of the period character by inserting a backslash before it. For example, when the expression b\. is used in the command syntax, only the string b. is matched.

You can also create multiple-character regular expressions with combination of letters, digits, and other keyboard characters.
For example:
abc33vu77 is a valid regular expression.

② User Exec Mode

Once you have accessed the router, you are automatically in User Exec mode. The following commands are valid in User EXEC mode. Some CLI commands may not be applicable to your model or running software.

clear ip dhcp binding

{clear ip dhcp binding * | A.B.C.D}

Syntax Description	clear ip dhcp binding
* | A.B.C.D}	Type * to clear all automatic bindings. Type the IPv4 address of the specific DHCP binding to clear.
Command Modes	Perle>clear ip dhcp binding

Usage Guidelines

Use this command to clear DHCP client bindings. The * parameter clears all or enter the IPv4 address to clear.

Examples

This example clears all IP DHCP client bindings.

Perle>clear ip dhcp binding *

This example clears IP DHCP bindings for a specified IP address.

Perle>clear ip dhcp binding 172.16.113.44

Related Commands

renew
release

enable

Syntax Description	enable
Command Modes	Perle>enable

Usage Guidelines

Use this command to elevate the user from user exec level to privileged level.

Examples

This example sets user level to privileged level.

>enable
Password:perle
Perle#

Related Commands

disable

exit

exit

Syntax Description	**exit**
Command Modes	Perle#exit

Usage Guidelines

Use this command to exit from EXEC mode.

Related Commands

logout
disable

line-attach

line-attach
{**tty** *<1-2> <WORD>*}

Syntax Description	**line-attach**
{**tty** *<1-2><WORD>*}	Applies only to models with serial ports.
	Displays available serial ports configured for ssh or telnet protocol.
	On user log in, line access privileges will be based on this authentication not the original authentication request.
	<WORD> SSH user name is optional. If it is not entered, the username logged into the router's main session is used.
Command Modes	Perle>line-attach

Usage Guidelines

Use this command to connect to serial ports configured as Console Management ports. The available ports for both Telnet and SSH are displayed. This feature only exists on models which have serial port/s.

Examples

This example connects a user to serial port 1.
Perle>line-attach tty 1

logout

logout

Syntax Description	**logout**
logout	Logs out of the router.
Command Modes	Perle>logout

Usage Guidelines

Use this command to log out of the router.

Examples

This example logs you out of your router.

Perle>logout

password

password

Syntax Description	**password**
Command Modes	Perle>password

Usage Guidelines

Allows logged in user to change their password.

Examples

This example changes a logged in user's password.

Perle> password

Password must be less than 128 characters long

May not use 5 previous Passwords

Enter Old password

Enter New password

Re-Enter new password

ping

ping
{*<WORD>* **data** *<HEX DIGITS>* | **repeat** *<1–2147483647>* | **size** *<36–18024>*}

Syntax Description	**ping**
{*<WORD>* **data** *<HEX DIGITS>*	**repeat** *<1–2147483647>*	**size** *<36–18024>*}	Configure the destination. ● IPv4 address or IPv6 address ● Host name (pre-configured in your router's host table) or a DNS server needs to be reachable ● Data—input in hex data to repeat ● Repeat—how many time to run the ping command ● Size—Configure the size of the packet to ping with
Command Default	56 (84) bytes of data 10 times
Command Modes	Perle>ping

Usage Guidelines

Use this command to ping a remote host.

This example pings a host with an IP address of 172.16.113.44 and repeats the ping 10 times.

Perle>ping 172.16.113.44 repeat 10
64 bytes from 172.16.4.90: icmp_seq=1 ttl=64 time=2.91 ms
64 bytes from 172.16.4.90: icmp_seq=1 ttl=64 time=1.17 ms
64 bytes from 172.16.4.90: icmp_seq=1 ttl=64 time=2.93 ms
64 bytes from 172.16.4.90: icmp_seq=1 ttl=64 time=1.666 ms
64 bytes from 172.16.4.90: icmp_seq=1 ttl=64 time=0.921 ms
64 bytes from 172.16.4.90: icmp_seq=1 ttl=64 time=1.05 ms
64 bytes from 172.16.4.90: icmp_seq=1 ttl=64 time=1.118 ms
64 bytes from 172.16.4.90: icmp_seq=1 ttl=64 time=1.00 ms
64 bytes from 172.16.4.90: icmp_seq=1 ttl=64 time=1.00 ms
64 bytes from 172.16.4.90: icmp_seq=1 ttl=64 time=1.50 ms
64 bytes from 172.16.4.90: icmp_seq=1 ttl=64 time=0.897 ms

Related Commands

testemail
testsms
show ip interface

release

release
{dhcp | dhcpv6 [bvi *1–9999*] | [dot11radio <0-4>] | [ethernet*<1-5> . <1–4000>*]}

Syntax Description	release dhcp | dhcpv6
{dhcp | dhcpv6 [bvi *1–9999*] | [dot11radio <0-4>] | [ethernet *<1-5>. <1–4000>*] }	Type the Ethernet interface (and sub-interface) or BVI interface to release the DHCP/DHCPv6 IP address. Ethernet values are *<1-5>* sub-interfaces 1–4000 bvi values are 1–9999 Dot11radio interface to release the DHCP / DHCPv6 IP address. Values are Dot11radio 0–4
Command Modes	Perle>release dhcp

Usage Guidelines

Use this command to release the DHCP/DHCPv6 IP address given to the router by the DHCP/DHCPv6 server. To obtain a new DHCP/DHCPv6 IP address lease, use the DHCP/DHCPv6 renew command.

Examples

This example releases the DHCP IP address for Ethernet interface 2.

Perle>release dhcp ethernet 2

Related Commands

renew

renew

renew
{**dhcp | dhcpv6 [bvi** *<1–9999>*] | [dot11radio <0-4>]| [ethernet *<1-5>* . *<1–4000>*]
}

Syntax Description	renew dhcp | dhcpv6
{**dhcp | dhcpv6 [bvi** *<1–9999>*] | [dot11radio <0-4>]| [ethernet *<1-5>* . *<1–4000>*] }	Type the Ethernet interface (and sub-interface) or BVI interface to renew the DHCP/DHCPv6 IP address. Ethernet values are *<1-5>*, sub-interfaces 1–4000 Bvi values are 1-9999 Type the dot11radio interface to renew the DHCP/DHCPv6 IP address. Values are 0–4.
Command Modes	Perle>renew dhcp

Usage Guidelines

Use this command to renew the DHCP/DHCPv6 IP address lease from the DHCP/DHCPv6 server pool.

Examples

This example renews the DHCP lP address lease on Ethernet 1.

Perle>renew dhcp eth 1

Related Commands

release

show alarm

show alarm
{**description port** |
profile [<*WORD*>**]** |
settings enabled |

[*<filter/redirection options>*]}

Syntax Description	**show alarm**
{**description port** |	Displays alarm statuses. ● 1—Link has failed ● 2—Port not-forwarding ● 3—Port not operating
**profile [*<WORD>*] |	Type the alarm profile name to view.
settings enabled |	Displays settings for enabled alarms.
[*<filter/redirection options>*]}	Output modifiers see ***Show Command Filtering and Redirection***
Command Modes	Perle>show alarm

Usage Guidelines

Depending on the model, your show alarms output maybe different.

Use this command to display alarm descriptions, profiles, and enabled alarms.

Link has failed—The router generates a link fault alarm when problems with a port's physical layer causes unreliable data transmission. A typical link fault condition is loss of signal or clock. The link fault alarm clears automatically when the link fault condition clears. The severity for this alarm is error condition, level 3.

Port not forwarding—Only used for Ethernet ports. The router generates a port not-forwarding alarm when a port is not forwarding packets. This alarm clears automatically when the port begins to forward packets. The severity for this alarm is warning, level 4.

Port not operating—The router generates a port not-operating alarm when a port fails during the startup self-test. When triggered, the port not-operating alarm only clears when the router is restarted and the port is operational. The severity for this alarm is error condition, level 3.

Output modifiers (Pipe redirect)—allows you to redirect the output to the options as specified.

Examples

To show alarm descriptions.
Perle>show alarms description
1 Link Fault
2 Port not Forwarding
3 Port Not Operating

```
Perle>show alarms profile
DefaultPort:
       Interfaces wlm0, eth1, eth2, eth3, eth4

Alarms     link fault, not operating
       Syslog     link fault, not operating
       Notifies    link fault, not operating
       Relay Major link fault, not operating
```

Related Commands

alarm

show arp

show arp
{**<A.B.C.D>** |

[*<filter/redirection options>*]}

Syntax Description	**show arp**
{**<A.B.C.D>** |	Displays the ARP table or entry.
{[*<filter/redirection options>*]}	Output modifiers see ***Show Command Filtering and Redirection***
Command Modes	Perle>show arp

Usage Guidelines

Use this command to display the ARP table or entry.

Output modifiers (Pipe redirect)—allows you to redirect the output to the options as specified.

Examples

This example displays the ARP table.
```
Perle>show arp
Address           Hardware Addr      Interface      Hw Type
172.16.23.124      6c:3b:e5:20:26:db  eth3           ether
172.16.73.200      a4:bb:6d:ac:5c:65  eth3           ether
```

Related Commands

clear arp-cache

arp

show clock

show clock
{[*<filter/redirection options>*]}

Syntax Description	**show clock**

{[*<filter/redirection options>*]}	Output modifiers see ***Show Command Filtering and Redirection***
Command Modes	Perle>show clock

Usage Guidelines

Use this command to display current clock information.

Output modifiers (Pipe redirect)—allows you to redirect the output to the options as specified.

Examples

This example shows you how to display clock information.
Perle>show clock
.Tue Mar 16 17:58:02 EDT 2021

Related Commands

clock

show crypto

show crypto

{**ipsec [client** *<WORD>*] | [**esp-group** *<WORD>*] | [**ike-group** *<WORD>*] | [**ipsec.conf**] | [**12tp**] | [**status**] |

openvpn ca [*<NAME>* | **cert [** *<NAME>*] | **connection [** *<WORD>*] | **dh [** *<WORD>*] | **key [** *<NAME>*] | **secret [** *<NAME>*] | [**status**] | **template [** *<NAME>*] |

pki client trustpoint | openvpn ca [*<NAME>*] | **cert [** *<NAME>* | **key [** *<NAME>*] | **server trustpoints [** *<WORD>*] | [**status**] |

ssl |

[*<filter/redirection options>*]}

Syntax Description	show crypto
{**ipsec [client** *<WORD>*]	[**esp-group** *<WORD>*]	[**ike-group** *<WORD>*]	[**ipsec.conf**]	[**12tp**]	[**status**]		Displays crypto details. Displays L2TP details. Displays status. IPsec client (peer)—typically @leftside or a hostname.
openvpn ca [*<NAME>*]	**cert [** *<NAME>*]	**connection [** *<WORD>*]	**dh [** *<WORD>*]	**key [** *<NAME>*]	**secret [** *<NAME>*]	[**status**]	**template [** *<NAME>*]}		Displays OpenVPN details.

pki client trustpoint | openvpn ca [*\<NAME\>*] | cert [*\<NAME\>* | key [*\<NAME\>*] | server trustpoints [*\<WORD\>*] | [status]		Displays details for pki client trustpoints, and OpenVPN.
ssl		Displays SSLdetails.
[*\<filter/redirection options\>*]}	Output modifiers see *Show Command Filtering and Redirection*

Command Modes	Perle>show crypto

Usage Guidelines

Use this command to display session information for encryption based services.

Examples

This example displays the version of SSL installed on the router.

Perle>show crypto ssl

SSL cipher suite: TLS v1.2

Related Commands

crypto

show dot1x

show dot1x
{**[all \| details \| statistics]** |
[credential *\<WORD\>*] |
[interface ethernet *\<1-5\>* details \| statistics] |
[radius statistics interface ethernet *\<1-5\>*] |
[*\<filter/redirection options\>*]}

Syntax Description	**show dot1x**
{**[all | details | statistics]**		Select all, details, or statistics to view dot1x connection details.
[credential *\<WORD\>*]		Displays the credential profile for this user.
interface ethernet *\<1-5\>* details | statistics]		Enter the Ethernet interface to show connections authenticated with dot1x.
[radius statistics interface ethernet *\<1-5\>*]		Displays RADIUS statistics for authenticator mode.
[*\<filter/redirection options\>*]}	Output modifiers see *Show Command Filtering and Redirection*

Command Modes	Perle>show dot1x

Usage Guidelines

Use this command to display the connection information for Dot1x supplicant and authenticator connections.

Output modifiers (Pipe redirect)—allows you to redirect the output to the options as specified.

```
Examples
This example displays all dot1x devices.
PerleRouter>show dot1x all
Sysauthcontrol            Enabled
Dot1x Protocol Version         3

Dot1x Info for Ethernet2
====================================
PAE  = AUTHENTICATOR
QuietPeriod   = 60
SuppTimeout = 30
ReAuthMax   = 2
MaxReq       = 2
TxPeriod     = 30
Dot1x Info for Ethernet2
====================================
PAE  = SUPPLICANT
StartPeriod  = 30 (fixed)
AuthPeriod   = 30 (fixed)
HeldPeriod  = 60 (fixed)
MaxStart     = 3  (fixed)
Credentials profile  = lfelton
EAP profile  = md5chap
```

show eap

show eap
{**profile** *<WORD>* |

registration |

[*<filter/redirection options>*]}

Syntax Description	show eap
{**profile** *<WORD>*		Displays pre-defined EAP profiles.
registrations		Displays registered EAP methods.

[*<filter/redirection options>*]}	Output modifiers see ***Show Command Filtering and Redirection***

Command Modes	Perle>show eap

Usage Guidelines

Use this command to display configured methods and pki-trustpoints for EAP configured profiles. EAP profiles are configured using the eap profile <name> command. The registration show command displays the EAP methods supported by your router.

Output modifiers (Pipe redirect)—allows you to redirect the output to the options as specified.

Examples

This example displays eap registrations.

Perle>show eap registrations

```
Registered EAP Methods:
========================
 Method  Type          Name
   4    Auth and Peer   MD5
   6    Auth and Peer   GTC
  13    Auth and Peer   TLS
  21    Auth and Peer   TTLS
  25    Auth and Peer   PEAP
  26    Auth and Peer   MSCHAPV2
```

show environment

show environment
{**alarm-contact | all | temperature status** |
[*<filter/redirection options>*]}

Syntax Description	**show environment**
{**alarm-contact	all	temperature status**		Shows alarm contact, all and temperature
[*<filter/redirection options>*]}	Output modifiers see ***Show Command Filtering and Redirection***

Command Modes	Perle>show environment

Usage Guidelines

Use this command to show the router's environment. Output can be different depending on your model.

Output modifiers (Pipe redirect)—allows you to redirect the output to the options as specified.

Examples

This example displays environment settings.

```
>show environment alarm-contact
External alarm contact A:
   Description: AUX-IO: Digital Input A
   Digital Input: Value: Closed  Transitions: 0  Pulses: 0
External alarm contact B:
   Description: AUX-IO: Digital Input B
   Digital Input: Value: Closed  Transitions: 0  Pulses: 0
External alarm contact 1:
   Description: DC-POWER: IGN
   Analog Input: Value: 0.17 Volts  Transposed Value: 9.962 Celsius
External alarm contact 2:
   Description: DC-POWER: GPIO
   Digital Input: Value: Closed  Transitions: 0  Pulses: 0
   Analog Input: Value: 1.15 Volts  Transposed Value: 1.148 kelvin
Perle>show environment alarm-contact
External alarm contact 1
    Description: DC-POWER:A1
    Analog Input: Value: 42.32 Volts Transposed Value:42.324 Volts
```

show facility-alarm

show facility-alarm
{**relay major** |
status |
[*<filter/redirection options>*]}

Syntax Description	**show facility-alarm**
{**relay major**		Displays alarms on major relay.
status		Displays facility alarm status.
[*<filter/redirection options>*]}	Output modifiers see *Show Command Filtering and Redirection*
Command Modes	Perle>show facility-alarm

Usage Guidelines

Use this command to display alarm statuses. Output can be different depending on your model.

Output modifiers (Pipe redirect)—allows you to redirect the output to the options as specified.

Examples

This example displays facility alarm statuses.
Perle>show facility-alarm status
Source   Severity   Description Actions

PerleServer   Minor Temperature below min secondary LOG,NOT,LTE-D MAJ

show flash:

show flash:
{[*<filter/redirection options>*]}

Syntax Description	show flash:
{[*<filter/redirection options>*]}	Output modifiers see *Show Command Filtering and Redirection*
Command Modes	Perle>show flash:

Usage Guidelines

Use this command to display files on the internal flash drive.

Output modifiers (Pipe redirect)—allows you to redirect the output to the options as specified.

Examples

Perle>show flash:
Directory of flash:
 14   drwx   4096 Dec 31 2019 19:00 -04:00 doc
 32   -rw-   932 Nov 23 2020 16:52 -04:00 perle-internal.log

show hosts

show hosts
{[*<filter/redirection options>*]}

Syntax Description	show hosts
{[*<filter/redirection options>*]}	Output modifiers see *Show Command Filtering and Redirection*
Command Modes	Perle>show hosts

Usage Guidelines

Use this command to display the host table.

Output modifiers (Pipe redirect)—allows you to redirect the output to the options as specified.

Examples

This example displays host table information.
```
Perle>show hosts
Default domain name is Perle
DNS lookup is enabled
Name servers are not configured

Host Table:
accounting-host 172.16.77.99
banking-host 172.16.88.99
test-host 172.16.55.44
```

show ip arp
{[*<filter/redirection options>*]}

Syntax Description	show ip arp
{[*<filter/redirection options>*]}	Output modifiers see *Show Command Filtering and Redirection*
Command Modes	Perle>show ip arp

Examples
```
Perle>show ip arp
Address          Hardware Addr       Interface    Hw Type
0.0.0.0          81:01:71:e1:71:51   eth3         ether
172.16.73.200    41:b1:d1:c1:c1:51   eth3         ether
172.16.1.1       41:c1:c1:a1:91:31   eth3         ether
172.16.23.124    c1:b1:51:a1:61:b1   eth3         ether
172.16.113.215   c1:b1:21:a1:21:11   eth3         ether
```

Usage Guidelines

Use this command to display ARP entries.

Output modifiers (Pipe redirect)—allows you to redirect the output to the options as specified.

Related Commands

show ip ddns

show ip ddns
{service [bvi *<1–9999>*] |[cellular *<0–0>*] | [dialer *<0–15>*] | [ethernet *<1-5>*] | [openvpn-tunnel *<0–999>*] | [tunnel *<0–999>*] |
use-web [bvi *<1–9999>*] |[cellular *<0–0>*] | [dialer *<0–15>*] | [ethernet *<1-5>*] |[openvpn-tunnel *<0–999>*] | [tunnel *<0–999>*] |
[*<filter/redirection options>*]}

Syntax Description	show ip ddns
{service [bvi *<1–9999>*] |[cellular *<0–0>*] | [dialer *<0–15>*] | [ethernet *<1-5>*] | [openvpn-tunnel *<0–999>*] | [tunnel *<0–999>*] |	Displays interfaces with DDNS service enabled.
use-web [bvi *<1–9999>*] |[cellular *<0–0>*] | [dialer *<0–15>*] | [ethernet *<1-5>*] |[openvpn-tunnel *<0–999>*] | [tunnel *<0–999>*] |	Web check used for obtaining the external IP address.
[*<filter/redirection options>*]}	Output modifiers see *Show Command Filtering and Redirection*
Command Modes	Perle>show ip ddns

Usage Guidelines

Use this command to display information for Dynamic DNS (DDNS).

Output modifiers (Pipe redirect)—allows you to redirect the output to the options as specified.

Examples

This example displays the DDNS service configured on Ethernet port 2.

```
Perle>show ip ddns service ethernet 1
Service dyndns
  Login    testddns
  Password  ********
```

show ip dhcp

show ip dhcp
{**bindings** |
pool *<WORD>* |

Syntax Description	show ip dhcp
{**bindings** | **pool** *<WORD>* |	Displays current bindings.
pool *<WORD>* |	Displays current DHCP configured pools.
[*<filter/redirection options>***]**}	Output modifiers see *Show Command Filtering and Redirection*
Command Modes	Perle>show ip dhcp

Usage Guidelines

Use this command to display DHCP bindings and pool information.

Output modifiers (Pipe redirect)—allows you to redirect the output to the options as specified.

Examples

This example displays the configured DHCP pools.

```
Perle>show ip dhcp pool
Pool pooltest:
  Total addresses: 11
  Leased addresses : 2
  Exluded addresses: 0
  IP address Range: 172.16.113.60 - 172.16.113.70
```

Syntax Description	show ip http
{**server status**		Displays the configured HTTP server parameters.
[*<filter/redirection options>*]}	Output modifiers see *Show Command Filtering and Redirection*
Command Modes	Perle>show ip http

Usage Guidelines

Use this command to display HTTP server information.

Output modifiers (Pipe redirect)—allows you to redirect the output to the options as specified.

Examples

This example displays the parameters for the HTTP server.

```
Perle>show ip http server status
HTTP server status: Enabled
HTTP server port:80
User session idle timeout: 1440 seconds
HTTP secure server status: Enabled
HTTP secure server port: 443
```

Syntax Description	show mab

{**all details | statistics** |	Displays MAB information.
interface ethernet *<1-5>* **details | statistics** |	Displays interface MAB details.
radius statistics interface ethernet *<1-5>* |	Displays RADIUS MAB details.
[*<filter/redirection options>*]}	Output modifiers see ***Show Command Filtering and Redirection***

Command Modes	Perle>show mab

Usage Guidelines

Use this command to display MAB (MAC Authentication Bypass) for the Ethernet interfaces or RADIUS.

Output modifiers (Pipe redirect)—allows you to redirect the output to the options as specified.

Examples:

Shows the MAB interface details for Ethernet interface 1.

```
Perle>show mab interface ethernet 1 details
Interface        Mac-Auth-Bypass
-----------------------------------
Ethernet3       Enabled
MAC Auth Bypass Client List
---------------------------
Supplicant        = 00:16:d3:2f:62:bb
 EAP Method        = None
 Port Control State  = Auto
 Auth SM State      = AUTHENTICATED
 Auth BkEnd SM State = IDLE
 Session ID        = B8B01A9D-00000001
 Session Time       = 855
 Identity          = 0016d32f62bb
Eapol Frame Counters:
 Frames Rx         = 2
 Frames Tx         = 0
 Start Frames Rx    = 2
Logoff Frames Rx   = 0
 RespId Frames Rx   = 0
 Resp Frames Rx     = 0
 ReqId Frames Tx    = 0
 Req Frames Tx      = 0
 Invalid Frames Rx  = 0
 Length Error Rx    = 0
 Last Frame Version = 1
 Last Frame Source = 00:16:d3:2f 62:bb
```

show mac

show mac
{access-list [all] | [interfaces] | [list-name <WORD>] |
address-table [address <H.H.H>] | [dynamic] | [interface ethernet <1-5>] |
[multicast] | [static] |
[<filter/redirection options>]}

Syntax Description	show mac
{access-list [all]	[interfaces]	[list-name <WORD>]		Displays MAC access list by all, interfaces or list-name.
address-table [address <H.H.H>]	[dynamic]	[interface ethernet <1-5>	[multicast]	[static]		Show MAC address details.
[<filter/redirection options>]}	Output modifiers see *Show Command Filtering and Redirection*
Command Modes	Perle>show mac

Usage Guidelines

Use this command to display a listing of MAC addresses and MAC access lists.

Output modifiers (Pipe redirect)—allows you to redirect the output to the options as specified.

Examples

Show the dynamic MAC address table.

Perle>show mac address-table dynamic

```
Mac Address Table
-------------------------------------------
Vlan    Mac Address      Type       Ports

show ntp

show ntp
{**associations** |

status |

[*<filter/redirection options>*]}

Syntax Description	**show ntp**
{**associations**		NTP clock associations information.
status		NTP clock status.
[*<filter/redirection options>*]}	Output modifiers see *Show Command Filtering and Redirection*
Command Modes	Perle>show ntp

Usage Guidelines

Use this command to display NTP associations and status.

Output modifiers (Pipe redirect)—allows you to redirect the output to the options as specified.

Examples

Perle>show ntp associations

```
remote       refid     st t when poll reach  delay  offset jitter
==============================================================
 172.16.55.77   .INIT.       16 u  - 1024  0   0.000   0.000  0.000
 172.16.113.55  .INIT.       16 s  -  32  0   0.000   0.000  0.000
```

Perle>show ntp status

Clock is not synchronized, stratum 16, no reference clock

Precision is 2**-18 s

Reference time is 00000000.00000000 (Thu, Feb 7 2036 2:28:16.000)

Clock offset is 0.000000 msec, root delay is 0.000 msec

Root dispersion is 1265.970 msec

System poll interval is 8 s

show terminal

show terminal

{**[<filter/redirection options>]**}

Syntax Description	show terminal
{**[<filter/redirection options>]**}	Output modifiers see *Show Command Filtering and Redirection*
Command Modes	Perle>show terminal

Usage Guidelines

Use this command to display terminal parameters length, width, history enabled, history size, and logging monitor.

Output modifiers (Pipe redirect)—allows you to redirect the output to the options as specified.

Examples

This examples displays the parameter for terminal.

```
Perle>show terminal
   Terminal length = 24
   Terminal width = 79
   Terminal history is enabled
   Terminal history size = 11
   Terminal logging monitor is OFF
```

show users

show users

{**all]** |

[*<filter/redirection options>*]}

Syntax Description	show version
{**[backup]** |	Displays backup version of software.
[flash:] |	Displays versions of software in on flash:
[startup] |	Displays the version of software used for startup.
[verbose]}	Displays details about software running on your router.
[*<filter/redirection options>*]}	Output modifiers see ***Show Command Filtering and Redirection***
Command Modes	Perle>show version

Usage Guidelines

Use this command to display software version information.

Output modifiers (Pipe redirect)—allows you to redirect the output to the options as specified.

Examples

This example displays the startup version of software.

```
Perle>show version
Perle IRG5000 Series Routers, Version: 4.5
```

ssh

ssh

{<A.B.C.D> <X:X:X:X::X> [-c | -h | -l | -p <A.B.C.D>]}

Syntax Description	ssh
{<A.B.C.D> <X:X:X:X::X> [-c | -h | -l | -p <A.B.C.D>]}	Configure a ssh session to a remote host. IPv4 or IPv6 address or hostname to connect to in *<A.B.C.D> <X:X:X:X::X>* format. • c–select the encryption method • h–select HMAC algorithm • l–log in using this user name • p–connect to this port
Command Modes	Perle>ssh

Usage Guidelines

Use this command to SSH from your router to a host supporting the SSH protocol.

Examples

This example connects to host (172.16.4.90) using lyn as the user.

Perle>ssh -l lyn 172.16.4.90

Related Commands

show ssh

telnet

telnet

{<A.B.C.D> | <X:X:X:X::X>}

Syntax Description	telnet
{<A.B.C.D> | <X:X:X:X::X>}	Configure a Telnet session to a remote host.
Command Modes	Perle>telnet

Usage Guidelines

Use this command to telnet from your router into a host that supports the telnet protocol.

Examples

This example telnets to host 172.16.4.90.

Perle>telnet 172.16.4.90
Trying 172.16.4.90...
Connected to 172.16.4.90.
Escape character is '^]'.

testemail
{email address}

Syntax Description	**testemail**

{**email address**}	Configure the email address. Format is user@company.com
Command Modes	Perle>testemail

Usage Guidelines

Use this command to send a test email message.

Examples

Perle>testemail ltest@bigshow.com
Email Test message sent to lfelton@perle.com

Related Commands

ping

testsms

testsms
{**phone number**}

Syntax Description	**testsms**
{**phone number**}	Configure the size of the history buffer.
Command Modes	Perle>testsms

Usage Guidelines

Use this command to send a SMS test text message.

Examples

Perle>testsms 6475554455
SMS Test message sent to 6475554455

Related Commands

ping

traceroute

traceroute
{*<A.B.C.D>* | **hostname** | **icmp** *<A.B.C.D>* | **hostname**}

Syntax Description	**traceroute**
{*<A.B.C.D>*	**hostname**| **icmp** *<A.B.C.D>*	**hostname**}	Destination hostname or address.
Command Modes	Perle>traceroute

Usage Guidelines

Use this command to trace network connections from one location to another. When a traceroute is run, it returns a list of network hops and displays the host name and IP address of each connection. It also returns the amount of time it took for each connection to take place (usually in milliseconds). This shows if there were any delays in establishing the connection. Therefore, if a network connection is slow or unresponsive, a traceroute can often explain why the problem exists and also show the location of the problem.

Examples

This example displays the hops it takes from the router to IP host address 172.16.4.90.

Perle>traceroute 172.16.4.90 (172.16.4.90), 30 hop max, 60 bytes packets
1 172.16.4.90 (172.16.4.90)   2.094ms   1.113 ms   0.826 ms

Related Commands

ping

two-factor

two-factor

{**email** *<WORD>* |

method email | **sms** | **phone** *<LINE>*}

Use the no form of this command to negate a command or set to defaults.

Syntax Description	two-factor
{**email** *<WORD>*		Sends the security key to this email address. Valid format is llhin@yahoo.ca
method email	**sms**	**phone** *<LINE>*}	Selects the method for sending the security key.
phone *<LINE>*}	Specify the phone number to send the 2-factor pin number.
Command Modes	Perle>two-factor

Usage Guidelines

Only cellular models have SMS capabilities.

Use this command to configure for two-factor authentication (2FA). Two factor authentication is a method of establishing access to your router by requiring you to provide two different types of information. You will need to provide both a password and key to prove your identity to gain access. Your router supports 2-factor using SMS and Email authentication.

Examples

This example sets your router for 2-Factor authentication using email.

Perle>two-factor
Perle>email janedoe@yahoo.ca

- The syntax for an SFTP server:

[sftp:*//[[//username:password]@location]/directory]/perle-image-name.img***]** \|

- The syntax for an TFTP server:

[tftp:*[[//location]/directory]/perle-image-name.img***]** \|

Examples

This example downloads software from a server with an IP address of 172.16.4.182 to your router using secure HTTP (https) and certificate named apache.crt

Step 1) Download a secure certificate to your router
(config)#crypto pki import server apache pem url
tftp://172.16.4.182/apache.crt

Step 2)
Configure your router with the certificate you just downloaded.
(config)#ip http client secure-trustpoint apache

Step 3)
Set validation off if you do not want to valid the certificate. (You must have created the certificate with validation if you want to valid the certificate)
#archive download-sw
https://172.16.4.182/public/router-software.img or .emg
depending on the running firmware.

The software is download using secure https.
This example upload software from a server with an IP address of 172.16.4.92 using scp.
This command is only supported on some models.

Perle#archive upload-sw
scp://lyn:mypassword@172.16.4.92/public//Router.img or .emg file
depending on the running firmware.

Related Commands
show archive

boot

boot

{**system backup**}

Syntax Description	**boot**
{**system backup**}	Boots the system with the backup image.
Command Modes	Perle#boot

Usage Guidelines

Use this command to boot the router using an older saved software version. Older software versions are stored as backup software using the archive command.

Examples

This example sets your router to boot using the backup software.
Perle#boot system backup

cd

cd

{flash: | nvram:}

Syntax Description	**cd**
**{flash:	nvram:}**	Change directory on flash: or nvram:

Command Modes	Perle#cd

Usage Guidelines

Use this command to change directory within the flash or nvram file systems.

Examples

This example changes to directory testdir under the flash file system.

Perle#cd flash:testdir

clear contact

clear contact

{*<2-2 >* **pulse-counter** \|

<A-B> **pulse-counter**}

Syntax Description	clear contacts

{<2-2 > **pulse-counter** |	Clears the digital input contact counters, also clears outstanding alarm.
<A-B> **pulse-counter**}	Clears the digital input contact counters, also clears outstanding alarm.
Command Modes	Perle#clear contacts

Usage Guidelines

Use this command to clear contacts and alarms. Input and output contacts are different or may not exist on some models.

Related Commands

show environment

clear counters

clear counters

{**[bvi** *<1-9999>***]** \| **[dot11radio** *<0-4>***]** \| **[ethernet** *<1-5>* \| **[loopback]** \| **[tunnel** *<0-999>***]**}

Syntax Description	**clear counters**
{**[bvi** *<1-9999>***]** | **[dot11radio** *<0-4>***]** | **[ethernet** *<1-24><1-5>***]** | **[loopback]** | **[tunnel** *<0-999>***]**}	Clears counters on specified interface.
Command Modes	Perle#clear counters

Usage Guidelines

Use this command to clear counters back to zero on the specified interface.

Examples

This example clears all counters for Ethernet interface 1.

Perle#clear counters ethernet 1
Clear "show interface" counters on this interface [confirm]

clear ip

clear ip

{**alg connections** \|

bgp * \| **[***<1-4294967295>***]** \| *<A.B.C.D>* \| **[***<X:X:X:X::X:X>***]** \| **[external in** \| **out** \| **soft]** \|

dhcp binding *<*** \| *<A.B.C.D>* \|

firewall *<WORD>* \|

ospf process \|

rip process \|

route-policy name *<WORD>* **counters | rule** *<1-9998>* **counters**}

Syntax Description	**clear ip**
{**alg connections**		Clears ALG connections.
bgp * | *<1-4294967295>* **|** *<A.B.C.D>* **|** *<X:X:X:X::X:X>* **|** [**external in	out	soft**] **|**	Type ***** to clear all BGP sessions or connections. Type the connection number, IPv4, or IPv6 address of the session or connection you want to reset. Configure whether it is an inbound or outbound session. No in/out parameters clears both in and outbound.
dhcp binding *<* |* *<A.B.C.D>* **|**	Type ***** to clear all automatic client bindings Type the ip address of the client you want to clear the DHCP binding.
firewall *<WORD>* **|**	Clears the specified firewall statistics.
ospf process |	Reset OSPF process.
rip process |	Reset RIP process.
route-policy name *<WORD>* **counters	rule** *<1-9998>* **counters**}	Clears counters for route policies.
Command Modes	Perle#clear ip

Usage Guidelines

Use this command to clear IP connections and statistics.

You can clear all DHCP bindings using the * parameter or clear only the binding for a specific IP address by entering in the IP address to clear.

You can also use this command to clear firewall statistics and counters for route policies.

Examples

This example clears all DHCP ip bindings from your DHCP router table.

Perle#clear ip dhcp bindings *

This example clears all BGP connections.

Perle#clear ip bgp *

clear ipv6

clear ipv6

{**firewall name** *<WORD>* **|**
neighbors *<X:X:X:X::X:X>* **|** [**bvi** *<1-9999>*] **|** [**cellular** *<0-0>*] **|** [**dialer** *<0-15>*] **|**
[**dot11radio** *<0-4>*] **|** [**ethernet** *<1-5>* **.** *<1-4000>*] [**vrrp** *<1-255>*] **|** [**openvpn-tunnel**
<0-999>] **|** [**tunnel** *<0-999>*] **|**

route-policy name *<WORD>* **counters | rule**}

Syntax Description	**clear ipv6**
{**firewall name** *<WORD>*|	Clears IPv6 firewalls.
neighbors *<X:X:X:X::X:X>* | **[bvi** *<1-9999>*] | **[cellular** *<0-0>*] | **[dialer** *<0-15>*] | **[dot11radio** *<0-4>*] | **[ethernet** *<1-5>* . *<1-4000>*] **[vrrp** *<1-255>*] | **[openvpn-tunnel** *<0-999>*] | **[tunnel** *<0-999>*] |	Clears IPv6 neighbors.
route-policy name *<WORD>* **counters	rule**}	Clears IPv6 route policies.
Command Modes	Perle#clear ipv6

Usage Guidelines

Use this command to clear IPv6 entries for IPv6 firewalls, neighbors, and route policies.

Examples

This example clears route policy warehouse.

Perle#clear ipv6 route-policy warehouse

Related Commands

show ipv6

ipv6

clear ldap

clear ldap

{**statistics**}

Syntax Description	**clear ldap**
{**statistics**}	Clears LDAP statistic information.
Command Modes	Perle#clear ldap

Usage Guidelines

Use this command to clear LDAP statistic information.

Examples

This example clears LDAP statistics information on your router.

Perle#clear ldap statistics

Related Commands

(config-ldap-server)

show ldap

clear line

clear line

{**console** *0-0* |

vty *<0-15* |

tty *<1-2>*}

Syntax Description	clear line
{**console** *0-0* |	Clears the console. Console and tty command only available on models with console ports/serial ports.
vty *<0-15>* |	Clears vty or tty sessions.
tty *<1-2>*}	Clears tty sessions. Console and tty command only available on models with console ports/serial ports.
Command Modes	Perle#clear line

Usage Guidelines

Use this command to clear the console, vty, or tty session. The session is disconnected and all statistics are cleared.

Examples

This example clears vty line 1.

Perle#clear line vty 1
[confirm]
[Dec 9 16:14:20 %REQHANDLE-6: Cleared VTY1 session
OK]

Related Commands

clear tacacs

clear tacacs

{**tacacs statistics**}

Syntax Description	clear tacacs
{**tacacs statistics**}	Clears TACACS+ statistics.
Command Modes	Perle#clear tacacs

Usage Guidelines

Use this command to clear TACACS+ statistics.

Examples

This example clears TACACS+ statistical information.

Perle#clear tacacs statistics

Related Commands

tacacs

tacacs-server

ip tacacs

(config-tacacs-server)

clock

clock

{**set hh:mm:ss | 1-31 | month year 2001-2037**}

Use the no form of this command to negate a command or set to defaults.

Syntax Description	clock

{**set hh:mm:ss | 1-31 | month | 2001-2037**}	Configure the current time and date.
	hh:mm:ss (hour, mins, secs)
	Day of the month 1-31
	Month is
	• January
	• February
	• March,
	• April
	• May
	• June
	• July
	• August
	• September
	• November,
	• December
	Year is 2001-2037

Command Modes	Perle#clock

Usage Guidelines

Use this command to configure the clock.

Examples

This example configures the clock to 5 hours off from UTC.
Perle#clock set 12:30:10 28 jan 2020

Related Commands

show clock

configure

configure

{**confirm** |

revert now | timer *<1-120 >* **| idle** *<1-120>* |

terminal lock | revert timer *<1-120>* **| idle** *<1-120>*}

Syntax Description	**configure**
{**confirm** |	Cancels the revert timer.
revert now | timer *<1-120 >* | **idle** *<1-120>* |	Configure the parameters for reverting this config using the rollback feature.
terminal lock | revert timer *<1-120>* | **idle** *<1-120>*}	Locks configuration mode. Revert timer.

Command Modes	Perle#configure

Usage Guidelines

Use this command to change from privileged level mode to configuration mode.

This command is also used to configure the parameters for the rollback and terminal lock features.

Examples

This example changes the user from privileged level mode to terminal configuration mode.

Perle#configure
Configuring from terminal, memory, or network [terminal]?
Perle(config)#

container (OCI)

container

{**connect** *<WORD>* | **exec** *<WORD> <CMDLINE> <WORD>* |**export-changes** *<WORD>* **flash:***<WORD>* |
image [add *<WORD> <WORD>* | **load-from** *flash:*] | **delete** *<WORD>* |
updatefilename *<WORD> <WORD>* |
restart *<WORD>* | **force-remove** *<WORD>* |
stop *<WORD>*}

Syntax Description	**container**
{**connect** *<WORD>*		**Connect**–container instance name. You must have a valid image loaded in your container in order to connect. To escape container instance type <CTRL>-p <CTRL>-q.
exec *<WORD>* **CMDLINE**	Executes the given command and arguments then redirects the output to your CLI screen. <WORD>–container name <CMDLINE>–command line to execute
export-changes *<WORD>* **flash:***<WORD>*		Export changes made in a container from the base container. Filename will normally end with a "tar.gz" because it will be a compressed tar file, although this is not required. Export-changes must be based on the "same" container image(such as alpine to alpine, not alpine to ubuntu).

image [add *<WORD>* *<WORD>* **| load-from flash:] | delete** *<WORD>* **| update filename** *<WORD>* *<WORD>* **|**	Pull the specified image for a container or load a tar image from our flash: volume. If no tag/digest is specified then the tag of latest will be used.
	Add–container image path and name
	container image tag or digest
	load-from–flash:
	Delete–image name (tag can be included)
	Update–container image path and name
	container image tag or digest
restart *<WORD>* **| force-remove** *<WORD>* **|**	**Restart**–restart container instance
	Forcefully–remove the container instance forcibly
stop *<WORD>***}**	**Stop**–container instance name
Command Modes	Perle#container

Usage Guidelines

Use this command to manage Open Container Initiative (OCI) containers images.

Your router supports the Open Container Initiative (OCI) software management container feature. Simply put, a software container bundles an application's code together with the related configuration files and libraries, and all dependencies required for a application to run. By using our OCI container management system, you are able to load images, create containers, and manage multiple containers, conveniently, and easily.

Your router allow you to deploy and run Open Containers Initiative (OCI) compatible containers from both public and private container registries, such as Open Containers, GitHub and Docker Hub. Your router supports the following OCI container specifications:

1. the Runtime Specification (runtime-spec),
2. the Image Specification (image-spec)
3. the Distribution Specification (distribution-spec).

Examples

This example shows you how to add an image to your container, then connect to that container.

```
Perle#container image add alpine
Pulling from library/alpine
Digest:sha256:bc41182d7ef5ffc53a40b044e725193bc10142a1243f395ee852a8d9
Status: Image is up to date for alpine:latest
#(config) container network test-network
(config-container-net)#network-interface bvi 1
#(config) container name test-container
#config) container network test-network
(config-container)#image alpine
#container restart test-container
#container connect test-container
/#
```

Syntax Description	copy
{**flash:***filename*	**ftp flash:**	**nvram:**	**running-config**	**startup-config :***filename*	**http:** *filename*	**https:***filename*	**nvram:** *filename*	**running-config** *filename*	**scp:** *filename*	**sftp:** *filename*	**startup-config** *filename*	**tftp:***filename*}	Copies from one file to another.
Command Modes	Perle#copy

Usage Guidelines

Use this command to copy a file from one location to another.

Examples

This example copies a file from the flash: directory to a TFTP server with an IPv4 address of 172.16.4.90.

```
Perle#copy flash:running-config-save tftp:
Address or name of remote host[ ]?172.16.4.90
Destination filename [ ]?backup-running-config<cr>
4922 bytes copied in 0.013 seconds
```

reload

reload

{**at** *hh:mm* |

cancel | **in** *mmm* | [*hh:mm*]}

Syntax Description	**reload**
{**at** *hh:mm* |	Configure **at**—the time in hours and minutes when to reload the firmware on the router.
cancel |	Configure **cancel**—any pending reload commands.
in *mmm* | [*hh:mm*]}	Configure **in**—minutes 1-999 or hours minutes when to reload the firmware on the router.
Command Modes	Perle#reload

Usage Guidelines

Use this command to reload the router's firmware. The routerpowers off and then reboots. Any configuration not copied from running-config to startup-config is lost.

Examples

Reloads the firmware on the router in 10 hours and 20 mins.

Perle#reload 10:20

Cancels the previous reload command.

Perle#reload cancel
*****
***** ----SHUTDOWN ABORTED ---
******

Related Commands

rename

rename

{**flash:** *<WORD>* | **nvram:** *<WORD>*}

Syntax Description	rename
{**flash:** *<WORD>*	**nvram:** *<WORD>*}	Renames the file.

Command Modes	Perle#rename

Usage Guidelines

Use this command to rename a file on flash or nvram.

Examples

This example rename a file on flash from testdir to newdir.

Perle#rename flash:testdir flash:backup
Destination file name[backup]?

serialt

serialt

{*<WORD>* #[mask] [...] [-full] [-size=# [-show]}

Syntax Description	serialt
{*<WORD>* #[mask] [...] [-full] [-size=# [-show]}	Only available on models with serial ports. Takes a serial line trace.
Command Modes	Perle#serialt

Usage Guidelines

Use this command to capture data on the serial line.

Examples

This example captures all data on serial port 1 and displays it to the screen.

Perle#serialt 1 -show
Tracing port 1=rx+tx+signals+special

To stop the trace press Ctrl-C
9

Use the "Space Bar" and the keys 1,2,3,4 to control the scrolling speed.
Please press the "Space Bar" to continue...............

Use the "Space Bar" and the keys 1,2,3,4 to control the scrolling speed.
Please press the "Space Bar" to continue...............

Decode Complete... 0 entries processed

```
SERIAL TRACE V1.00

To start a serial trace:
========================
serialt #[=mask] [...] [-full] [-size=#] [-show]
        |  |   |      |        |            |
        |  |   |      |        |            then show the trace file
        |  |   |      |        size in kilobytes (2-1024)
        |  |   |      stop when trace file full else wrap
        |  |   another port/mask to simultaneously trace
        |  optional trace mask any combination of:
        |  rx+tx+signals+special+ioctl or use: normal,all,same
        port number 1->max

Serial trace file utilities:
============================
serialt [-show] [-remove]
        |          |
        |          remove the trace file
        show the trace file
```

Syntax Description   **show bgp**

{**bgp community** |	Displays the routes matching the communities.
community-list *<1-500 >* | *<WORD>* **exact-match** |	Displays the routes matching the community list.
filter-list *<WORD>* |	Displays the routes conforming to the filter list.
memory |	Displays Global BGP memory statistics.
neighbors *<A.B.C.D>* | *<X:X::X:X>* |	Detailed list for TCP and BGP neighbor connections.
prefix-list *<WORD>*|	Displays the routes matching the prefix-list.
regexp *<LINE>* |	Displays the routes matching the AS path regular expression.
route-map *<LINE>* |	Displays the routes matching the route-map.
[*<filter/redirection options>*]}	Output modifiers see ***Show Command Filtering and Redirection***

Command Modes	Perle#show bgp

Usage Guidelines

Use this command to show BGP information.

Output modifiers (Pipe redirect)—allows you to redirect the output to the options as specified.

Examples

This example displays BGP neighbors.

Perle#show bgp neighbors
BGP neighbor is 172.16.39.2, remote AS 65537, local AS 65536, external link
  BGP version 4, remote router ID 172.16.39.2
  BGP state = Established, up for 00:14:28
  Last read 05:39:27, hold time is 180, keepalive interval is 60 seconds
  Neighbor capabilities:
    4 Byte AS: advertised and received
    Route refresh: advertised and received(old & new)
    Address family IPv4 Unicast: advertised and received
Message statistics:
  Inq depth is 0
  Outq depth is 0

Syntax Description	**show ip access-lists**
{extended *<100-199> <2000-2699>* **| standard** *<1-99> <2000-2699>* **|**	Displays Extended and standard IP access lists.
[*<filter/redirection options>***]}**	Output modifiers see *Show Command Filtering and Redirection*
Command Modes	Perle#show ip access-lists

Usage Guidelines

Use this command to display configured access lists.

Output modifiers (Pipe redirect)—allows you to redirect the output to the options as specified.

Examples
Perle#show ip access-lists
Extended IP access list 100
10 permit any any

Related Commands

show ip alg

show ip alg {table |
[*<filter/redirection options>***]}**

Syntax Description	**show ip alg**
{table |	Displays ALG entries.
[*<filter/redirection options>***]}**	Output modifiers see *Show Command Filtering and Redirection*
Command Modes	Perle#show ip alg table

Usage Guidelines

Use this command to display Application Level Gateway (ALG) entries.

Output modifiers (Pipe redirect)—allows you to pipe the output to the redirect options as specified.

Examples

This example displays ip alg table information.

Perle#show ip alg table

```
CONN-ID      Source                Destination              Protocol    Timeout   State

show ip arp

show ip arp {*<A.B.C.D>* |

[*<filter/redirection options>*]}

Syntax Description	show ip arp
{*<A.B.C.D>* |	Displays the ARP entry for the specified IPv4 address.
[*<filter/redirection options>*]}	Output modifiers see ***Show Command Filtering and Redirection***
Command Modes	Perle#show ip arp

Usage Guidelines

Use this command to display ARP table details.

Output modifiers (Pipe redirect)—allows you to redirect the output to the options as specified.

Examples

Perle#show ip arp

Address	HWtype	HWaddress	Flags Mask	Iface
172.16.113.20	ether	78:2B:cb:a5:b4:0c	CM	eth1

show ip as-path-access-list

show ip as-path-access-list

[*<filter/redirection options>*]}

Syntax Description	show ip as-path-access-list
[*<filter/redirection options>*]}	Output modifiers see ***Show Command Filtering and Redirection***
Command Modes	Perle#show ip as-path-access-list

Usage Guidelines

Use this command to show as-path access list.

Output modifiers (Pipe redirect)—allows you to redirect the output to the options as specified.

Examples

This example displays as-path access list.BGP neighbors.

```
Perle#show as-path-access-list
AS path access JoeAS-Path
permit def
deny abc
```

Syntax Description	show ip bgp
{*<A.B.C.D>/nn <A.B.C.D>*		Displays BGP network routing table.
cidr-only		Displays only routes with non-natural netmasks.
community		Displays routes matching the communities.
community-info		Displays all BGP community information.

community-list *<1-500>* | *<WORD>* **exact-match** |	Displays routes matching the community list.
dampened-paths |	Displays paths suppressed due to dampening.
filter-list *<WORD>* |	Displays routes conforming to the filter list.
flap-statistics |	Displays flap statistics of routes.
ipv4 unicast |	Displays address family.
neighbours *<A.B.C.D>* *<X:X:X:X::X>* | **advertised-routes** | **dampened-routes** | **flap-statistics** | **prefix-count** | **[received prefix-filter]** | **received-routers** | **routes**	Displays detailed information on TCP and BGP neighbor connections.
paths |	Displays path information.
prefix-list *<WORD>* |	Displays routes matching the prefix list.
regexp *<LINE>* |	Displays routes matching the AS path regular expression.
route-map *<WORD>* |	Displays routes matching the route map.
summary |	Displays the summary of BGP neighbor statuses.
[*<filter/redirection options>*]}	Output modifiers see *Show Command Filtering and Redirection*
Command Modes	Perle#show ip bgp

Usage Guidelines

Use this command to display BGP information.

Output modifiers (Pipe redirect)—allows you to redirect the output to the options as specified.

Examples

This example displays BGP information.

Perle#show ip bgp

BGP table version is 0, local router ID is 172.16.113.215
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
r RIB-failure, S Stale, R Removed
Origin codes: i - IGP, e - EGP, ? - incomplete

Network	Next Hop	Metric	LocPrf	Weight Path

Syntax Description	show ip dns
[*<filter/redirection options>*]}	Output modifiers see *Show Command Filtering and Redirection*
Command Modes	Perle#show ip dns

Usage Guidelines

Use this command to display IP DNS configuration and information.

Output modifiers (Pipe redirect)—allows you to redirect the output to the options as specified.

Examples

This example displays all DNS settings.

Perle# show ip dns

```
IP DNS
======
DNS Lookup Enabled
Listen Addresses:
192.168.0.1
Cache Size          10000
Ignore Host File    Off
Negative TTL        3600
No Name Servers Configured
Name Servers obtained from DHCP on the following interfaces:
wlm0

show ip nat

show ip nat

{**statistics** |

translations |

[*<filter/redirection options>*]}

Syntax Description	show ip nat
{**statistics**		Displays the Network Address Translation (NAT) source statistics table.
translations		Displays the pre-nat and post-nat translations. table.
[*<filter/redirection options>*]}	Output modifiers see *Show Command Filtering and Redirection*
Command Modes	Perle#show ip nat

Usage Guidelines

Use this command to display the router's's Network Address Translation Table (NAT) statistics and translations.

Output modifiers (Pipe redirect)—allows you to redirect the output to the options as specified.

Example

This example displays IP NAT translations.

Perle#show ip nat translations

```
NAT Source Translations
Pre-NAT              Post-NAT              Prot     Timeout

show ip ospf

show ip ospf

{[border-routers] |

[database] |

[interface] |

[neighbor] |

[route] |

[*<filter/redirection options>*]}

Syntax Description	show ip ospf
{[border-routers] |	Displays border and boundary router information.
[database] |	Displays database summary.
[interface] |	Displays interface information.
[neighbor] |	Displays neighbor list.

[neighbor] |	Displays OSFP routing table.
[<*filter/redirection options*>]}	Output modifiers see *Show Command Filtering and Redirection*
Command Modes	Perle#show ip ospf

Usage Guidelines

Use this command to show the router's OSPF routing processes.

Output modifiers (Pipe redirect)—allows you to redirect the output to the options as specified.

Examples

Perle#show ip ospf
OSPF Routing Process, Router ID: 172.16.39.2
Supports only single TOS (TOS0) routes
This implementation conforms to RFC2328
RFC1583Compatibility flag is disabled
Opaque Capability flag is disabled
Initial SPF scheduling delay 200 millisec(s)
Minimum hold time between consecutive SPFs 1000 millisec(s)
Maximum hold time between consecutive SPFs 10000 millisec(s)
Hold time multiplier is currently 1
SPF algorithm last executed 7m53s ago
SPF timer is inactive
Refresh timer 10 secs
Number of external LSA 0. Checksum Sum 0x00000000
Number of opaque AS LSA 0. Checksum Sum 0x00000000
Number of areas attached to this router: 1
Area ID: 0.0.0.0 (Backbone)
  Number of interfaces in this area: Total: 1, Active: 1
  Number of fully adjacent neighbors in this area: 0
  Area has no authentication
  SPF algorithm executed 1 times
  Number of LSA 1
  Number of router LSA 1. Checksum Sum 0x00001e7a
  Number of network LSA 0. Checksum Sum 0x00000000
  Number of summary LSA 0. Checksum Sum 0x00000000
  Number of ASBR summary LSA 0. Checksum Sum 0x00000000

  Number of NSSA LSA 0. Checksum Sum 0x00000000

show ip rip

show ip rip {[status] |

[*<filter/redirection options>*]}

Syntax Description	show ip rip status
{[status] |	Displays RIP information.
[*<filter/redirection options>*]}	Output modifiers see *Show Command Filtering and Redirection*
Command Modes	Perle#show ip rip status

Usage Guidelines

Use this command to display rip status information.

Output modifiers (Pipe redirect)—allows you to redirect the output to the options as specified.

Examples

This example shows rip status information.

Perle#show ip rip
Routing Protocol is "rip"
Sending updates every 30 seconds with +/-50%, next due in 30 seconds
Timeout after 180 seconds, garbage collect after 120 seconds
Outgoing update filter list for all interface is not set
Incoming update filter list for all interface is not set
Default redistribution metric is 1
Redistributing:
Default version control: send version 2, receive any version
Interface   Send Recv   Key-chain
Routing for Networks:
Routing Information Sources:
Gateway   BadPackets BadRoutes Distance Last Update
Distance: (default is 120)

show ip route

show ip route {[**table** *<1-200>*] |

[*<filter/redirection options>*]}

Syntax Description	show ip route
{[**table** *<1-200>*] |	Displays ip routes or route table. Tables must be pre-defined by the user.
[*<filter/redirection options>*]}	Output modifiers see *Show Command Filtering and Redirection*
Command Modes	Perle#show ip route

Usage Guidelines

Use this command to show configured tables for ip routing.

Output modifiers (Pipe redirect)—allows you to redirect the output to the options as specified.

Examples

Shows ip route table entries.

Perle#show ip route
table:200

Related Commands

ip route

show ip route-policy

show ip route-policy {[*<NAME>*] |

show logging

show logging

[*<filter/redirection options>*]}

Syntax Description	show logging
[*<filter/redirection options>*]}	Output modifiers see *Show Command Filtering and Redirection*
Command Modes	Perle#show logging

Usage Guidelines

Use this command to display the logging buffer. Logging buffer output may be different on some models.

Output modifiers (Pipe redirect)—allows you to redirect the output to the options as specified.

Examples

This example shows the logging buffer.

Perle#show logging
Syslog logging: enabled (764643 messages processed, 0 messages rate-limited, 0
                              overruns)
    Console logging: level debugging, 71 messages logged
    Monitor logging: level debugging, 71 messages logged
        Logging to:
    Buffer logging: level debugging, 1344 messages logged
    File logging: disabled
    Trap logging: level informational
        Logging Source-Interface:
 Log Buffer (16384 bytes):
 Sep 26 20:51:57 %REQHANDLERD-6: CONSOLE: initializing usb serial console
                              mode
 Sep 26 20:52:02 %IPSEC_STARTER-6: Starting strongSwan 5.6.2 IPsec [starter]...
 Sep 26 20:52:02 %IPSEC_STARTER-6: charon is already running (/var/run/
                              charon.pid exists) -- skipping daemon start

show management-access

show management-access

[*<filter/redirection options>*]}

Syntax Description	show management-access
[*<filter/redirection options>*]}	Output modifiers see *Show Command Filtering and Redirection*
Command Modes	Perle#show management-access

Usage Guidelines

Use this command to display management access and access restrictions from the LAN and WAN side.

Output modifiers (Pipe redirect)—allows you to redirect the output to the options as specified.

Examples

This example shows management access methods for LAN/WAN and TRUSTED interfaces.

Perle#show management-access

```
Management Access is disable

LAN:  eth1 eth1.2 eth1.10 eth1.100 eth1.200 eth2.400 wlan0 wlan1 wlan3 wlan4 br10
      HTTP        HTTPS       TELNET      SSH         SNMP        HTTP-RESTFUL    HTTPS-RESTFUL
      ENABLE      ENABLE      ENABLE      ENABLE      ENABLE      ENABLE          ENABLE

WAN:  wlm0 pppoe0 pppoe5 pppoe10
      HTTP        HTTPS       TELNET      SSH         SNMP        HTTP-RESTFUL    HTTPS-RESTFUL
      DISABLE     DISABLE     DISABLE     DISABLE     DISABLE     DISABLE         DISABLE

TRUSTED:  tun10
      HTTP        HTTPS       TELNET      SSH         SNMP        HTTP-RESTFUL    HTTPS-RESTFUL
      ENABLE      ENABLE      ENABLE      ENABLE      ENABLE      ENABLE          ENABLE
```

show nat66

show nat66

{**prefix** |

statistics |

[*<filter/redirection options>*]}

Syntax Description	show nat66
{**prefix** |	Display NAT66 prefixes.
statistics |	Display NAT66 statistics.
[*<filter/redirection options>*]}	Output modifiers see *Show Command Filtering and Redirection*
Command Modes	Perle#show nat66

Usage Guidelines

Use this command to display Network Address Translations (NAT) for IPv6 networks.

Output modifiers (Pipe redirect)—allows you to redirect the output to the options as specified.

Examples

This example shows NAT66 statistics

Perle#show nat66 statistics
Global Stats:
 ID:0
 Packets translated In -> Out
 1290003
 Packets translate Out -> In
 1290003

show network-watchdog

show network-watchdog

[*<filter/redirection options>*]}}

Syntax Description	show network-watchdog
[*<filter/redirection options>*]}	Output modifiers see ***Show Command Filtering and Redirection***
Command Modes	Perle#show network-watchdog

Usage Guidelines

Use this command to display network watchdog status and configuration.

Output modifiers (Pipe redirect)—allows you to redirect the output to the options as specified.

Examples

This example shows network-watchdog.

Perle#show network-watchdog
Network Watchdog Configuration/Status:
===
Network-watchdog Modem
 Configuration:
 Watchdog: Enable
 Target: 172.16.23.100
 Interface:
 Interval: 10m
 Threshold: 3
 Ping Count: 1
 Ping Timeout: 5s
 Fail Action: notification-only
Test Status:
 Total Success Count: 10 Since last reset Success Count: 9
 Total Failed Count: 1 Failed Tests 1/3 Next Test 0:0 (Min:sec)
 Reset Count: 1

Network-watchdog Router
      Configuration:
        Watchdog: Enable
        Target: 172.16.23.100
        Interface: eth1
        Interval: 1m
        Threshold: 2
Ping Count: 1
        Ping Timeout: 2s
        Fail Action: notification-only
      Test Status:

show rest-api

show rest-api
{**jwt** | **server status** |
[<*filter/redirection options*>]}

Syntax Description	show rest-api
{**jwt**	**server status**		Show RESTful API information.
[<*filter/redirection options*>]}	Output modifiers see ***Show Command Filtering and Redirection***
Command Modes	Perle#show rest-api

Usage Guidelines

Use this command to display RESTful API information.

Output modifiers (Pipe redirect)—allows you to redirect the output to the options as specified.

Examples

This example displays RESTful API information.

Perle#show rest-api server status
RESTful API HTTP server status: Disabled
RESTful API HTTP server port: 8080
Cookie maximum age timeout: 1440 seconds
RESTful API HTTPS server status: Disabled
RESTful API HTTPS server port: 8443

show route-map {[*<WORD>*] |

[*<filter/redirection options>*]}

Syntax Description	**show route-map**
{*<WORD>* |	Displays specified route map.
[*<filter/redirection options>*]}	Output modifiers see *Show Command Filtering and Redirection*
Command Modes	Perle#show route-map

Usage Guidelines

Use this command to display route map information.

Output modifiers (Pipe redirect)—allows you to pipe the output to the redirect options as specified.

Example

Shows route map details.
Perle#show route-map route1
RIB:
route-map route1, permit, sequence 2
  Match clauses:
  Set clauses:
  Call clause:
  Action:
    Exit routemap
RIP:
route-map route1, permit, sequence 2
Match clauses:
  Set clauses:
  Call clause:
  Action:
    Exit routemap

RIPV6:
route-map route1, permit, sequence 2
  Match clauses:
  Set clauses:
  Call clause:
  Action:
    Exit routemap
OSPF:
route-map route1, permit, sequence 2
  Match clauses:
  Set clauses:
  Call clause:

Syntax Description	**show running-config**
{**[all]**		Displays all config including defaults.
[*<filter/redirection options>*]}	Output modifiers see *Show Command Filtering and Redirection*
Command Modes	Perle#show running-config

Usage Guidelines

Use this command to display the router's current running config. To make this configuration permanent you must copy running config to startup config.

Output modifiers (Pipe redirect)—allows you to redirect the output to the options as specified.

Related Commands

show startup-config

show sdm

show sdm

{**prefer** |

[*<filter/redirection options>*]}

Syntax Description	show sdm
{**prefer**		Displays the value for sdm.
[*<filter/redirection options>*]}	Output modifiers see ***Show Command Filtering and Redirection***
Command Default	Both IPv4 and IPv6
Command Modes	Perle#show sdm

Usage Guidelines

Use this command to display IPv4/IPv6 protocols running on your router

Output modifiers (Pipe redirect)—allows you to redirect the output to the options as specified.

Examples

This example displays the current value for sdm.

Perle#show sdm prefer
The current template is 'dual-ipv4-and-ipv6 default template

Related Command

[location]		Displays location information.
[mib ifmib ifindex]		Displays SNMP ifmib information.
[user]		Displays SNMP users.
[view]		Displays SNMP views.
[<*filter/redirection options*>]}	Output modifiers see ***Show Command Filtering and Redirection***

Command Modes	Perle#show snmp

Usage Guidelines

Use this command to display SNMP configured options.

Output modifiers (Pipe redirect)—allows you to redirect the output to the options as specified.

Examples

This example show the configured options for SNMP.

Perle#show snmp view
View name: router-view
  include: iso, exclude

Related Commands

snmp-server

show ssh
See *show ssh*

show startup-config
show startup-config

[*<filter/redirection options>*]}

Syntax Description	**show startup-config**
{[**<filter/redirection options>*]**}	Output modifiers see *Show Command Filtering and Redirection*
Command Modes	Perle#show startup-config

Usage Guidelines

Use this command to display the router's startup configuration. This is the configuration which is used when the device is first powered up or re-booted.

Output modifiers (Pipe redirect)—allows you to redirect the output to the options as specified.

Related Commands

show running-config

show system

show system

{[**hardware**] |

[**statuses**] |

[**uptime**] |

[**versions verbose**] |

[**<filter/redirection options>**]}

Syntax Description	**show system**
{[**hardware**]		Displays hardware details.
[**statuses**]		Displays system statuses for alarms, memory, flash etc:
[**uptime**]		Displays router's uptime.
[**versions verbose**]		Displays router's software versions.
[**<filter/redirection options>**]}	Output modifiers see *Show Command Filtering and Redirection*
Command Modes	Perle#show system

Usage Guidelines

Use this command to displays information about software versions.

Output modifiers (Pipe redirect)—allows you to redirect the output to the options as specified.

This is a sample of the type of information presented. The specific information displayed on your system is model Dependant.

Perle#show system statuses

show task-status

show task-status
{[*<filter/redirection options>*]}

Syntax Description	**show task-status**

{[<filter/redirection options>]}	Output modifiers see ***Show Command Filtering and Redirection***
Command Modes	Perle#show task-status

Usage Guidelines

Use this command to display system running tasks.

Output modifiers (Pipe redirect)—allows you to pipe the output to the redirect options as specified.

Examples

Perle#show task-status

```
top - 22:28:58 up  4:15,  0 users,  load average: 0.04, 0.10, 0.18

show tech-support

show tech-support

{[<filter/redirection options>]}

Syntax Description	**show tech-support**
{[<filter/redirection options>]}	Output modifiers see ***Show Command Filtering and Redirection***
Command Modes	Perle#show tech-support

Usage Guidelines

Use this command to capture internal router information. It will capture a large range of information which you could send to Perle technical support to assist in resolving issues.

Output modifiers (Pipe redirect)—allows you to pipe the output to the redirect options as specified.

show terminal

See *show terminal*

show username

show username
{[*<WORD>*] |
[*<filter/redirection options>*]}

Syntax Description	**show username**
{[*<WORD>*] |	Type the username to display.
[*<filter/redirection options>*]}	Output modifiers see *Show Command Filtering and Redirection*
Command Modes	Perle#show username

Usage Guidelines

Use this command to display information about a user.

Output modifiers (Pipe redirect)—allows you to redirect the output to the options as specified.

Examples
Perle#show username lyn
username   lyn
  privilegeLevel 15
  Password: ********
  password created: Fri Sep 18 21:18:27 testtime zone 2020
  Two Factor   Disabled

Related Commands

show users

show users

See *show users*

show version

See *show version*

show vrrp

show vrrp
{**interface** |
[status] |
[*<filter/redirection options>*]}

Syntax Description	show vrrp
{**[interface]**		Displays VRRP information for specified interface.
[status]		Displays VRRP statistics.
[*<filter/redirection options>*]}	See ***Show Command Filtering and Redirection***
Command Modes	Perle#show vrrp

Usage Guidelines

Use this command to display VVRP interface information and statistics.

Output modifiers (Pipe redirect)—allows you to redirect the output to the options as specified.

Examples

This example displays VRRP information on Ethernet interface 1.

```
Perle#show vrrp interface 1
Interface: eth1
--------------
  Group: 10
  ----------
  State:    FAULT
  Last transition:  12m23s

  Priority:   100
  Advertisement interval: 1000 milli-sec
  Preempt:   enabled

  VIP count:   1
    172.16.44.55/16
```

Related Commands

vrrp

show wan

show wan
{**failover source-interface | status |wan-interface** |
high-availability |
load-sharing rules | status |

[*<filter/redirection options>*]}

Syntax Description	**show wan**
{**failover source-interface** | **status** |**wan-interface** |	Displays WAN source interface configuration and status.
high-availability |	Displays WAN management.
load-sharing rules | **status** |	Displays load sharing configuration and status.
[*<filter/redirection options>*]}	Output modifiers see ***Show Command Filtering and Redirection***
Command Modes	Perle#show wan

Usage Guidelines

Use this command to show wan configured features for fail over, high-availability and load sharing.

Output modifiers (Pipe redirect)—allows you to redirect the output to the options as specified.

Examples

This example displays WAN management.

```
Perle#show wan high-availablity
WAN High Availability
====================
  Mode: DISABLED

WAN Failover Primary Active Interface:
======================================
  DISABLED

WAN Load Failover Interfaces Health Status:
===========================================
  DISABLED

WAN Load Share Global Settings:
==============================
  Include Local Traffic:        enabled
  Source IP NAT:                disabled
  Track inbound Connections:    enabled
  Flush Connections on Failure:  enabled
WAN Load Sharing Interfaces Health Status:
==========================================
  DISABLED
```

Related Commands

show zone-policy

show zone-policy

{**zone** *<WORD>* |

[*<filter/redirection options>*]}

Syntax Description	show zone-policy
{**zone** *<WORD>* |	Displays specified zone policy.
[*<filter/redirection options>*]}	Output modifiers see *Show Command Filtering and Redirection*
Command Modes	Perle#show zone-policy

Usage Guidelines

Use this command to show zone policy for the specified zone.

Output modifiers (Pipe redirect)—allows you to redirect the output to the options as specified.

Related Commands
zone-pair

shutdown

shutdown

Syntax Description	shutdown
{**shutdown**}	Shutdown the router. The Reset button brings system backup.
Command Modes	Perle#shutdown

Usage Guidelines

Use this command to shutdown the router.

ssh

See *ssh*

standby

standby

{**resume-standby-configuration**}

Syntax Description	standby

{**resume-standby-configuration**}	Resumes current standby configuration.

Command Modes	Perle##standby

Usage Guidelines

Use this command to force standby mode or resume from forced standby mode.

Examples

This example displays how to resume standby configuration.

Perle#standby resume
Resuming all power standby-mode configuration.

Related Commands

Syntax Description	**undebug**
{**alarmgr**		Turns off alarmgr debug.
all		Turns all debug off.
bgp		Turns off BGP debug.
bridge spanning-tree packet		Turns off bridge spanning-tree debug.
cellular-gnss		Turns off cellular-gnss debug.
cellular-lte		Turns off cellualar debug.
clpd		Turns off clpd debug.
dialer		Turns off dialer debug.
dot11-ap		Turns off dot11-ap debug.
dot11-station		Turns off dot11 station debug.
dot1x-authenticator		Turns off dot1x authenticator debug.
dot11-supplicant		Turns off dot1x debug.
drmgrd		Turns off drmgrd debug.
email		Turns off email debug.
init		Turns off init process debug.

ip |	Turns off ip process debug.
ip-passthrough |	Turns off ip-pass through debug.
ipsec |	Turns off IPsec debug.
kernel |	Turns off kernel debug.
lldp |	Turns off LLDP debug.
logging |	Turns off logging debug.
ntp |	Turns off NTP debug.
rest-api |	Turns off RESTful API debug.
snmp |	Turns off SNMP debug.
trapmgr |	Turns off trapmgr debug.
tty |	Turns off tty debug.
vrrp |	Turns off VRRP debug.
vty |	Turns off vty debug.
wan-highavail |	Turns off wan-highavail debug.
wanifmgr}	Turns off wanifmgr debug.

Command Modes	Perle#undebug

Usage Guidelines

Use this command to turn debugging mode off for a process.

Examples

This example turns off debugging for alarmmgr.

Perle#undebug alarmgr
Alarm Manager debugging is off

Related Commands

copy
password
traceroute

④ Global Configuration Mode

This chapter defines all the CLI commands in Global Configuration Mode. Some CLI commands may not be applicable to your model or running software.

aaa

aaa

{**[accounting dot1x default start-stop group** *<WORD>* **radius | tacacs] | [exec** *<WORD>* **| default none | start-stop broadcast | group |radius | tacacs | stop-only broadcast | group |radius | tacacs] | [system default none | start-stop]** |

authentication attempts login *<1-25>* **| [dot1x default group** *<WORD>* **| radius] | [login** *<WORD>* **group** *<WORD>* **| ldap | local | none | radius | tacacs | default group** *<WORD>* **| group | ldap local | none | radius | tacacs] | [two-factor pin-attempts** *<1-10>* **| pin-size** *<4-6>* **| pi n-tries** *<1-10>* **| [wan-only off | on]** |

authorization [console] | [exec *<WORD>* **| group** *<WORD>* **if-authenticated | local | none | radius | tacacs]** |

group server [ldap *<WORD>***] | [radius** *<WORD>***] | [tacacs** *<WORD>***]** |

local [authentication attempts max-fail *<1-65535>***] | [username min-len** *<1-32>***] | [lockout-time** *<30-65535>***]** |

password expiry *<1-999>* **| pbkdf2 rounds** *<1000-100000000>* **| restriction enable | group [lower-case** *<1-5>* **| numeric** *<1-5>* **| special | upper-case** *<1-5>* **| max-len** *<1-128>* **| min-len** *<1-64>* **| reuse** *<1-32>***]**}

Use the no form of this command to negate a command or set to defaults.

Syntax Description	**aaa**
{**[accounting dot1x default start-stop group** *<WORD>* **radius	tacacs]	[exec** *<WORD>* **| default none	start-stop broadcast	group |radius	tacacs	stop-only broadcast	group |radius	tacacs]	[system default none	start-stop]**		When AAA accounting is enabled, the router reports user activity to the TACACS+ or RADIUS security server (depending on which security method is selected) in the form of accounting records.This allows the AAA accounting feature to track the services that users are accessing and the amount of network resources that users are consuming. Each accounting record contains accounting attributes that are stored on the security server. This data can then be analyzed for network management, client billing, and auditing. If using groups a pre-defined group must have been previously created.
authentication attempts login *<1-25>* **	[dot1x default group** *<WORD>* **	radius]	[login** *<WORD>* **group** *<WORD>* **	ldap	local	none	radius	tacacs	default**	Configure authentication parameters. Authentication verifies users before they are allowed access to the network and network services (which are verified with authorization).

group *<WORD>* | **group** | **ldap local** | **none** | **radius** | **tacacs]** | **[two-factor pin-attempts** *<1-10>* | **pin-size** *<4-6>* | **pi n-tries** *<1-10>* | **[wan-only off** | **on]** |	The default method list is automatically applied to all interfaces except those that have a named method list explicitly defined. A defined method list overrides the default method list.The first listed method is used. If it fails to respond, the second one is used, and so on. **Two factor** authentication parameters for pin attempts, size, and retries. **WAN-only** **Off**—all admin users, (privilege 15), require two factor authentication. **On**—admin users (privilege 15), require two factor authentication only for remote network connections.
authorization [console] | **[exec** *<WORD>* | **group** *<WORD>* **if-authenticated** | **local** | **none** | **radius** | **tacacs]** |	Configure parameters for the authorization EXEC command. This determines if the user is allowed to run in EXEC mode. EXEC authorization applies to vty and tty lines.The first listed method is used. If it fails to respond, the second one is used, and so on.
group server [ldap *<WORD>***]** | **[radius** *<WORD>***]** | **[tacacs** *<WORD>***]** |	Configure a group server for LDAP, RADIUS or TACACS+.
local [authentication attempts max-fail *<1-65535>***]** | **[username min-len** *<1-32>***]** | **[lockout-time** *<30-65535>***]** |	Configure local user failed authentication attempts. Value is 1–65535 attempts Default is never lock the user out. On the FN router the default is 5 attempts, then the user is locked out for one hour. Configure the minimum length for user names. Values are 1 to 32 Default is minimum length of 1. Lock out time is 30 to 65535 in minutes.
password expiry *<1-999>* | **pbkdf2 rounds** *<1000-100000000>* | **restriction enable** | **group [lower-case** *<1-5>* | **numeric** *<1-5>* | **special** | **upper-case** *<1-5>* | **max-len** *<1-128>* | **min-len** *<1-64>* | **reuse** *<1-32>***]}**	Configure password restrictions. ● Password cannot be the same as User name ● Cannot have 3 consecutive characters in the same password ● No password is not allowed ● Special character are any non alphanumeric character

	• Minimum number of lowercase characters is 1–5
	• Minimum number of lowercase numeric numbers is 1–5
	• Minimum number of special characters is 1–5
	• Minimum number of uppercase characters is 1–5
	• Number of times a password can be changed before it can be reused.
	Value is 1–32 times
	pbkdf2 round default is 100000
	The larger number of rounds, the more secure password hashing, however slower logins will occurs.
Command Modes	Perle(config)#aaa

Usage Guidelines

Configure Authentication, Authorization, and Accounting parameters.

Examples

This example generates start and stop accounting records.

Perle(config)#aaa accounting network default start-stop group radius

This example configures authentication and authorization to RADIUS as the first method to authenticate/authorize, then local database as the second method for all users.

Perle(config)#aaa authentication login default group radius local

Perle(config)#aaa authorization exec default group radius local

This example sets two-factor authentication attempts to 2.

Perle(config)#aaa authentication two-factor pin-attempt 2

Use the no form of this command to negate a command or set to defaults.

Syntax Description	alarm

{contact *<1-2> <1-1>* analog [coefficient *< -2147483.647 -2147483.646>*] | [offset *< -2147483.647 - 2147483.6476*] | [units *<LINE>*] | description *<LINE>*] | [severity major | minor | none] {*<2>* analog coefficient *< -2147483.647 -2147483.646>* | offset *< -dry | wet*] | [trigger closed | open] | [output sink] | [pulse-counter mode pulses | transitions] | [trigger open | closed] | [severity major | minor | none] |	Configure the DC-Power alarm contact settings <1-2>. Configure the Analog Input AI settings <1-1>. Configure the AUX-IO alarm contact settings <A-B>. **Severity** • Major—immediate action needed • Minor—minor warning condition. **Note:** Relay Minor not available on the IRG5410 model, Relay Minor only available if GPIO is configured as an output. Some options not available on some models or running firmware. Set the alarm trigger closed— assert alarm with contact is closed open—assert alarm when the contact is open
facility input-alarm *<1>* analog [high *< -2147483.647 - 2147483.6476*] | [low *< -2147483.647 - 2147483.646>*] | [lte-data-disc] | [notifies] | [relay minor relay-mode energized] | [syslog] | [standby-mode disable | [lte-data-disc] | [notifies] | [relay minor] | [syslog] | temperature primary high *<-150-300>* | low *<-200 -250>* | [lte-data-disc] | [notifies] | relay [minor | major] | [syslog] | secondary high *<-150-300>* | low*<-200 - 250>* | [lte-data-disc] | [notifies] | [relay] | [syslog] |	Configure external input alarm for DC-Power <1-2> or AUX-IO <A-B> alarm contact. Dual power supplies supported on 5140 models only. Configure Power Standby-mode settings.
profile *<WORD>* |	See *(config-alarm-profile)#* for configuring parameters.
relay major relay-mode energizer | [minor relay-mode energized] |	Configure relay parameters. **Severity** • Major—immediate action needed • Minor——minor warning condition
Command Modes	alarm

Usage Guidelines

Use this command to configure parameters for alarms.

Examples

This example enables Input A digital to trigger an alarm on digital open.

PerleRouter(config)#alarm facilty input a digital enable

Related Commands

show alarm

(config-alarm-profile)#

(config-alarm-profile)#

{**alarm | link-fault | not-forwarding | not operating** |

notifies | link-fault | not-forwarding | not operating |

relay | [major link-fault | not forwarding | not operating] | [major | minor |

syslog link-fault | not-forwarding | not operating}

Use the no form of this command to negate a command or set to defaults.

Syntax Description	(config-alarm-profile)#
{**alarm | link-fault | not-forwarding | not operating** |	Monitors for alarm type. ● link-fault ● port-not-forwarding ● port-not-operating
notifies | link-fault | not forwarding | not operating |	Sends a trap/notification to the configured SNMP host trap receivers on the triggering and clearing of the alarms. ● link-fault ● port-not-forwarding ● port-not-operating
relay | [major link-fault | not forwarding | not operating] | [minor link fault | not-forwarding | not operating] |	Energizes/de-energizes relay on the triggering and clearing of an alarm.
syslog link-fault | not-forwarding | not operating	Sends a syslog message to the configured syslog host on the triggering and clearing of these alarms. ● link-fault ● port-not-forwarding ● port-not-operating
Command Modes	Perle(config-alarm-profile)#

Usage Guidelines

Use this command to configure alarm profile parameters.

Examples

This example configures an alarm profile to monitor for link fault and send a syslog message to the configured server.

Perle(config))#alarm profile test-alarm
Perle(config-alarm-profile)#alarm link-fault
Perle(config-alarm-profile)#syslog link-fault

archive

(config-archive)#

{**maximum** *1-14* |
path flash: | ftp: | http: | https: | scp: | sftp | tftp: |
time-period *<0-525600>* |
update-sw check | auto-download |
write-memory}
Use the no form of this command to negate a command or set to defaults.

Syntax Description	(config-archive)#
{**maximum** *1-14*		Configure the number of configuration archives to keep in the archive list. Archive list can contain between 1–14 configurations.
**path flash:	ftp:	http:	https:	scp:	sftp	tftp:**		Configure the file system path for archived configurations. The path must exist.
time-period *<0-525600>*		Configure the time period to automatically save the running configuration to an archive file.
**update-sw check	auto-download**		Enables update-software check. Check default is Disabled Auto-download is enabled for FN models
write-memory}	Enables—saves the configuration to an archive file each time you copy running-config to start-up config.
Command Default	no path maximum 10 no time-period no write-memory
Command Modes	Perle(config-archive)#archive

Usage Guidelines

Use this command to configure the full path to store archive configuration files.

flash:*perle-image-name.img*

ftp:*[[//username[:password]@location]/directory]/perle-image-name.img* **http://***[[username:password]@][hostname | host-ip [directory] /perle-image-name.img*

https://*[[username:password]@][hostname | host-ip [directory] /perle-image-name.img |*

scp:*[[username@location]/directory]/perle-image-name.img |* **sftp:***[[// username[:password]@location]/directory]/perle-image-name.img |* **tftp:***[[// location]/directory]/perle-image-name.img*

Examples

This example sets up an archive path for the write-memory command.

Perle(config-archive)#path flash:
Perle(config-archive)#write-memory
Perle(config-archive)#exit
Perle(config)#exit

If you do not supply a filename, then your running config is named with the current date and time. See below.
Perle#show flash:
Directory of flash:

arp

arp
{<A.B.C.D> <H.H.H> **[bvi** *<1-9999>]* **| | [dot11radio** *<0-4>]* **||ethernet** *<1-5> . <1-4000>]*}

Use the no form of this command to negate a command or set to defaults.

Syntax Description	**arp**
{<A.B.C.D> <H.H.H> **bvi** *<1-9999>]* **||[dot11radio** *<0-4>]* **| [ethernet** *<1-5>. <1-4000>]*}	Add static ARP entry to the ARP table.
Command Modes	Perle(config)#arp

Usage Guidelines

Use this command to add ARP entries to ARP table.

Examples

Add this ARP entry to the ARP table.

Perle(config)#arp 172.16.44.55 1234.1234.1234 bvi 2

Related Commands

show arp

banner

banner
{*<LINE>* |

login *<LINE>* |

motd *<LINE>* |

prompt-timeout}

Use the no form of this command to negate a command or set to defaults.

Syntax Description	banner
{*<LINE>* |	Configure a delimiting character to indicate the start and end of the message. It cannot be a character that you use in the message. Do not use " or % as a delimiting character. No white space characters are allowed.
login *<LINE>* |	Configure the login banner.
motd *<LINE>* |	Configure the message of the day (MOTD) on login.
prompt-timeout *<LINE>*}	Configure the message for login authentication timeout.
Command Modes	Perle(config)#banner

Usage Guidelines

Use this command to configure a banner or message of the day to display to users.

delimiter character—indicates the start and end of the message and is not a character that you use in the message. Do not use " or % as a delimiting character. White space characters do not work.

banner text—the text is alphanumeric, case sensitive, and can contain special characters. It cannot contain the delimiter character you have chosen. The text has a maximum length of 80 characters and a maximum of 40 lines.

The banner has special macros that are inserted into the banner.

They are:

$(hostname) which is the hostname you configured on the switch and **$(domain)** which is the domain name you configured on the router.

login—set login banner

motd—set message of the day (motd)

prompt-timeout—login authentication timeout

Banner applies to all consoles and vty sessions.

Examples

Displays a message of the day at login.

```
Perle(config)#banner motd line
Enter text message. End with the character 'l'
Good morning crew

Enter configuration commands, one per line. End with CNTL/Z
```

This example sets the domain name to be used in the banner, then set a banner of Good morning and Welcome to your domain. Domain is replaced with the domain name of MYTEST-DOMAIN.

```
Perle(config)# ip domain-name MYTEST-DOMAIN
Perle(config)#banner hGood morning and Welcome to your h
$(domain)
```

Related Commands

(config-line)#console

boot

boot

{**host dhcp | [retry timeout** *<600-65535>*]}

Use the no form of this command to negate a command or set to defaults.

Syntax Description   **boot**

{**host dhcp** | **[retry timeout** *<600-65535>***]**}	Configure boot parameters.
	host dhcp—enables Zero Touch provisioning (ZTP). Download configuration via DHCP server.
	host retry timeout—sets the time in seconds to wait for ZTP to complete (including time to download config or software).
	no boot host retry timeout—waits indefinitely for ZTP to complete.
Command Modes	Perle(config)#boot

Usage Guidelines

Use this command to enable ZTP. This command allows you to download your config and firmware via your DHCP server.

Examples

This example configures ZTP so that configuration and firmware files are downloaded from your DHCP server.

Perle(config)#boot host dhcp

bridge

bridge

{**bridge** *<1-4000>* **spanning-tree** \| **protocol ieee** \| **spanning-tree logging**}

Use the no form of this command to negate a command or set to defaults.

Syntax Description	**spanning-tree**
{**bridge** *<1-4000>* | **spanning-tree** | **protocol ieee** |	Configure the bridge range and spanning-tree. Values are 1 to 4000.
spanning-tree logging}	Configure spanning tree logging.
Command Modes	Perle(config)#spanning-tree bridge

Usage Guidelines

Use this command to configure a bridge range and enable spanning tree sub-menu. Spanning Tree Protocol (STP) is a loop free topology for an Ethernet local area network. If loops are detected, the protocol blocks one of the paths to eliminate the loop. STP prevents bridge loops and broadcast radiation. The spanning-tree protocol is applied to previously defined bridge interfaces.

Examples

This example configures bridge 10 with spanning-tree.

Perle(config)#bridge 10 spanning-tree
Perle(config-st-bridge)#

Related Commands

(config-st-bridge)#

(config-st-bridge)#
{**aging -time** *<10-1000000>* |

port-fast disable | edge | network |
priority *<0-61440>* |
root |
transmit hold-count *<1-10>*}
Use the no form of this command to negate a command or set to defaults.

Syntax Description	**(config-st-bridge)#**
{**aging -time** *<10-1000000>* |	Configure the timeout period in seconds, for aging out dynamically learned forwarding information. Values are 1 to 1000000 in seconds Default is 300 seconds
forward-time *<4-30>* |	Configure the forward delay timer. The forward delay timer is the time interval spent in the listening and learning state. Values are 4 to 30 seconds Default is 15 seconds.
hello-timer *<1-10>* |	Configure the hello timer. The hello timer is the time between each bridge protocol data unit (BPDU) sent on a port. Values are 1 to 10 seconds Default is 2 seconds.
loopguard default |	Configure the Spanning Tree Protocol (STP) loop guard feature which provides additional protection against Layer 2 forwarding loops (STP loops).

	An STP loop is created when an STP blocking port in a redundant topology erroneously transitions to the forwarding state.
	Default is Disabled
max-age *<10-1000000>* |	Configure the max age timer to control the maximum length of time that passes before a bridge port saves its configuration BPDU information.
	Value are 10 to 100000 seconds Default is 20 seconds
max-hops *<6-40>* |	Configure the number of possible hops in the region before a bridge protocol data unit (BPDU) is discarded.
	Value are 6 to 40 Default is 20
mode mstp | rstp | stp |	Set the spanning tree mode. • Spanning Tree Protocol (STP) • Rapid Spanning Tree Protocol (RSTP) • Multiple Spanning Tree Protocol (MSTP) Default is RSTP
mst instance *<0-4000>* | **name** *<WORD>* **revision** *<0-65535>* |	Configure MST instances for the region. Each region can have multiple instances. Map VLANs to an MST instance (0-63). Instance 0 cannot be deleted and is used to map/unmapped VLANs to instance 0. Each instance has a VLAN or range of VLANs which is associated with it.
	Name—define the name of the region.
	Revision—This setting must be the same for all MSTP switches in the same MST region
port-fast disable | edge | network |	A spanning tree normal port is one that functions in the default manner for spanning tree. Under normal circumstances it will transition from the Listening, Learning, Forwarding stages based on the default timers. PortFast causes a port to enter the spanning tree forwarding state immediately, bypassing the listening and learning states.

	STP enabled ports that are connected to devices such as a single switch, workstation, or a server can access the network only after passing all these STP states. Some applications need to connect to the network immediately, else they will timeout.
	Disable—go through normal learning/forwarding and blocking states.
	Network—Interface goes into forward state immediately. Portfast network protects against loops by detecting unidirectional links in the STP topology.
	Edge—is used to configure a port on which an end device is connected such as a PC. All ports directly connected to end devices cannot create bridging loops in the network. Therefore, the edge port directly transitions to the forwarding state, and skips the listening and learning stages. However, the specific command configures a port such that if it receives a BPDU, it immediately loses its edge port status and becomes a normal spanning-tree port.
priority *<0-61440>* |	Every router participating in a Spanning Tree Protocol (STP) network is assigned with a numerical number called a bridge priority value. Priority values decide who will be elected as root. You can set the bridge priority in increments of 4096 only.
	When you set the priority, valid values are 0, 4096, 8192, 12288, 16384, 20480, 24576, 28672, 32768, 36864, 40960, 45056, 49152, 53248, 57344, and 61440.
	You set the priority value argument to 0 to make the router root.
	Default is 32768
root |	Configure the root bridge.The root bridge is the bridge with the smallest (lowest) bridge ID.
transmit hold-count *<1-10>*}	Controls the number of BPDUs sent before pausing for 1 second.
	Range is 1 to 10 seconds Default is 6 seconds
Command Modes	Perle(config-st-bridge)#

Usage Guidelines

Configures the parameters for Spanning Tree Protocol.

Examples

This example sets mode to MSTP.

Perle(config-st-bridge)#spanning-tree mode mstp

class-map

class-map {*<1-4094>*}

Use the no form of this command to negate a command or set to defaults.

Syntax Description	**class-map**
{*<1-4094>*}	Configure a class-map number. Priority queues can only use class 1–7.
Command Modes	Perle(config)#class-map

Usage Guidelines

Use this command to classify inbound network traffic destined to, or passing through, the router based on a series of flow match criteria.The class map classifies network traffic based on various match criteria configured within a class map. In other words, it defines traffic classes. A class map can reference an ACL to be used as the criteria or specific criteria is applied to the class map. Class maps in turn are referenced by policy maps.

Examples

This example creates class map 1.

Perle(config)#class-map 1

mark *<1-214748748364>* |	Match on mark applied by policing routing.
vlan *<1-4000>*}	Match on VLAN ID
Command Modes	Perle(config-cmap-match)#

Usage Guidelines

Use the match command to configure "rules" or matches to apply to the class-map. If the packet matches any of the criteria configured for this class map, then this class map is applied to the packet.

Examples

This example I have specified the name bridge-50-match and matched on ip source address of 172.16.88.88.

Perle(config-cmap)#match-name bridge50-map
Perle(config-cmap-match))#match ip source address 172.16.88.88 icmp

[*<LAST>***] |**
timezone *<WORD> <-23 - 23>* **| [***<0-59>***]**}

Use the no form of this command to negate a command or set to defaults.

Syntax Description	clock
{**summer-time** *<WORD >* **date** *<1-31> <MONTH > <hh:mm> <1-31>* *<MONTH > < hh:mm >* **[***<1-1440-in-minutes>***]	[***recurring <1-4 >***]** **[***<FIRST >***] [***<LAST>***]**	Configure the name of the summer time zone followed by start/end dates. **Configure start time:** • numeric value for the day of the month to start summer timezone 1–31 • numeric value for the day of the month to start summer timezone 1–31 • name of the month to start January, February, March, April, May, June, July, August, September, October, November, December • time to start in hours (24 hour clock) and minutes **Configure end time:** • numeric value for the day of the month to end summer timezone 1–31 • name of the month to end (January, February, March, April, May, June, July, August, September, October, November, December)
	• time to end in hours (24 hour clock) offset in minutes 1–1440
timezone *<WORD> <-23 - 23>* **| [***<0-59>***]**}	Configure the timezone as hours/minutes offset from Universal Time Clock (UTC).

Command Modes	Perle(config)#clock

Usage Guidelines

Use this command to configure the clock.

Examples

This example configures the clock 6 hours off from UTC.

Perle(config)#clock timezone ont-time-zone -6

container (OCI)

container

{**name** *<LINE >* |
network *<WORD>* |
registry - | **[-** | **hostname:port username** *<WORD>* **secret** *<WORD>* |}

Use the no form of this command to negate a command or set to defaults.

Syntax Description	container
{**name** *<LINE >*		Create container with this name.
network *<WORD>*}	Create container with this network name.
registry -	**hostname:port username** *<WORD>* **secret** *<WORD>*|}	Registry • - (use default docker registry) • - hostname:port Username–specify the user Secret–specify a password for this user
Command Modes	Perle(config)#container

Usage Guidelines

Use this command to configure container parameters.

Examples

This example creates container network new-container.

Perle(config)#container network new-container <cr>

Perle(config-container-net)#

This example show you how to supply registry credentials to add images from repositories that require a CA certificate, cert, and key file.

First add the host to the router host table
Perle(config)#ip host lab-debian 172.16.48.20

Second upload the registry keys that are need for this host.
Perle(config)#crypto pki import container-registry lab-debian:443 ca   url http://lab-debian/certs/ca.crt

Perle(config)#crypto pki import container-registry lab-debian:443 cert url http://lab-debian/certs/myrouter.cert

Perle(config)#crypto pki import container-registry lab-debian:443 key url http://lab-debian/certs/myrouter.key

Perle(config)#container registry lab-debian:443 username admin secret perle1

Perle#container image add lab-debian:443/myimage

log max-size *<100-10000>* | **no-compress** |
memory *<1-1024>* |
network *<WORD>* **ip address** *<A.B.C.D>* | **ipv6 address** *<X:X:X:X::X>* |
restart-policy always | no | on-failure [*<0-9999>***]**}
Use the no form of this command to negate a command or set to defaults.

Syntax Description   **(config-container)#**

{**arguments** *<LINE> <1-40> <LINE>* |	**Line**–arguments to be supplied to the image when the container runs, redirect the output to your CLI screen.
	<1-40>–order of the arguments passed to the container when it runs. Best practice is to add arguments in increments of 10, such as 10, 20, 30, so that you are able to insert arguments between numbers.
	<LINE>–arguments to be supplied to the container when it runs.
	Note: your CLI prompt will not return until the program has finished running.
clean-restart |	On bootup or restart container, container will be removed first before restarting.
description *<LINE>* |	**Description**–container description.
	Max is 32 characters.
disable	**Disable**–disable container instance.
environment *<WORD> <LINE>* |	**WORD**–add a custom environment variable.
	LINE–set environment variable.
image *<WORD>* **image** *<WORD> <WORD>* **[autoadd]** ||	**WORD**–image name.
	WORD–container image tag or digest
	Autoadd–automatically download image if required.
import-changes |	Run the image modified with the supplied file from an earlier export-changes.
log max-size *<100-10000>* | **no-compress** |	Specify the size of the log file. Maximum size of the log file is in KiB.
	Turn compress of the rotating log files off.
memory *<1-1024>* |	**Memory**–container memory in megabytes (MB).
network *<WORD>* **ip address** *<A.B.C.D>* | **ipv6 address** *<X:X:X:X::X>* |	**WORD**–creates a container with the given name
	ip/ipv6–assigns static ip or ipv6 address.

restart-policy always | no | on-failure [*<0-9999>*]}	**Restart–policy** **Always**–restart containers when they exit, regardless of status exit code, retrying indefinitely. **no**–do not restart containers on exit. **on-failure**–restart containers when they exit with a non-zero exit code, retrying <0-9999> times. Default is: on failure 100 retries, 0 for infinite.
Command Modes	(config-container)#

Usage Guidelines

Use this command to configure container parameters.

Examples

This example creates a container called test-container1 with a static IP address of 172.16.88.88.

(config-container)#network-container test ip address 172.16.88.88 <cr>

This example adds argument ps -aef to container test. On connect to the container this argument will be run on the container and output will be redirected to your CLI prompt.

(config)#container name test <cr>
(config-container)#image alpine <cr>
(config-container)#argument 1 ps <cr>
(config-container)#argument 2 -eaf <cr>
(config-container)#no disable <cr>

#show container test log <cr>
PID USER TIME .....COMMAND
    1 root   0:00   ps-aef

Use the no form of this command to negate a command or set to defaults.

Syntax Description	**(config-connection)**
{ca *<WORD>* **|**	Configure the PKI CA trustpoint name.
cert *<NAME>* **|**	Configure the PKI certificate name.
**cipher aes-128-cbc	aes-128-gcm	aes-192-cbc	aes-192-gcm	aes-256-cbc	aes-256-gcm	bf-cbc	camellia-128-cbc	camellia-192-cbc	camellia-256-cbc	cast5-cbc	des-cbc	des-ede-cbc	des-ede3-cbc	des-cbc	rc2-40-cbc	rc2-64-cbc	rc2-cbc	seed-cbc |**	Configure the cipher for this connection.
client |	Enables client mode if TCP mode is used with the remote command or if you receive the OpenVPN message "Options error: --proto tcp is ambiguous in this context. Please specify --proto tcp-server or --proto tcp-client

client-to-client |	Sets client to client mode for the connection. This lets connected clients see each other, not just the server.
comp-lzo [adaptive | no | yes] |	Configure compression.
	In cases where the OpenVPN server pushes the request "comp-lzo no" to connecting clients, the client side breaks with repeated "write to TUN/TAP : Invalid argument (code=22)" errors unless it too has already specified "comp-lzo no.
	If you are a client and are using `pull` to get settings from the server, the connection may fail with that same message. To overcome this issue `comp-lzo no` must be defined in your connection.
	Note: the "no comp-lzo" (the default) turns off the entire compression subsystem which is required for connections not using compression.
dev *<0-999>* |	Configure the OpenVPN interface number.
dh *<WORD>* |	Configure Diffie-Hellman parameters.
ifconfig *<A.B.C.D> <WORD> <A.B.C.D> <WORD>* |	Configure the local and the remote IP addresses for each side of the connection. Reverse the ip addresses when configuring "the other end".
keepalive *<1-65535> <1-65535>* |	Configure the keepalive interval (in seconds) and the keepalive timeout (in seconds).
key *<WORD>* |	Configure the PKI private key.
lport *<1-65535>* |	Configure the port on the local side. Default is 1194
persist-tun |	Keeps tun device between restarts.
port *<1-65535>* |	Configure the port on both sides of the connection.
pull |	Downloads the configuration from the server.
remote [*<A.B.C.D>***|***<WORD>* | *<X:X:X:X::X> <1-65535>***]** | **[tcp | udp]** |	Configure the remote host for connection.

remote-cert-tls client | server |	Configure peer certificate checking as client or server.
	When this is used with a TLS connection, the peer's certificate credentials are validated using the CA certificate referred to by the "ca" command.
	This is recommended to mitigate man-in-the-middle attacks but can be left off if the signing CA certificate is not currently available.
rport *<1-65535>* |	Configure the port on the remote side.
secret *<NAME>* |	Configure the Pre-Shared secret key.
server *<A.B.C.D> <A.B.C.D>* **[no pool]** |	Configure OpenVPN IPv4 server parameters.
server-bridge *<A.B.C.D> <A.B.C.D> <A.B.C.D> <A.B.C.D>* |	Configure the gateway and IP pool addressing.
server-ipv6 *<X:X:X:X::X>* |	Configure OpenVPN IPv6 server parameters.
template *<WORD>* |	Configure the connection template.
tls-auth |	Sets a PSK to use for TLS authentication. The PSK previously defined via crypto openvpn generate secret name will be used. This can be used to add authentication to the TLS control channel to help reduce the chances of a DoS attack.
tls-client |	Sets the router to act as a TLS client.
tls-server |	Sets the router to act as a TLS server.
user-pass *<WORD> <WORD>* **0 | 7** |	Configure the remote user name and password.
user-pass -verify |	Enables or disables server username and password verification.
verb *<0-11>*}	Configure the verbosity level. (debug)
Command Modes	Perle(config-connection)#

Usage Guidelines

Use this command to configure parameters for OpenVPN connections.

Examples

Configure OpenVPN remote port to 1050.

Perle(config-connection)#rport 1050

{**aggressive-mode** |

dpd action clear | hold | restart | interval *<2-86400>* **| timeout** *<10-86400>*|

ike-version ike | ikev1 | ikev2 |

lifetime *<30-86400>* |

proposal [dh-group 2 | 5 | 14 | 15 | 16 | 17 | 18 | 19 | 20 | 21 | 22 | 23 | 24 | 25 | 26] |
[encryption 3des | aes128 | aes128gcm128 | aes256 | aes256gcm256 |
chacha20poly1305] | [hash md5 | sha1 | sha256 | sha384 | sha512]}

Use the no form of this command to negate a command or set to defaults.

Syntax Description	(config-ike) #
{**aggressive-mode**		Enables or disables aggressive mode. Aggressive mode uses fewer packet exchanges, therefore it is faster then main mode. However, aggressive mode does not give identity protection of the two IKE peers, unless digital certificates are used.
	This means VPN peers exchange their identities without encryption (clear text). You must use aggressive mode if one or both peers have dynamic external IP addresses or if you use Network Address Translation Traversal (NAT-T) Default is Off

dpd action clear | hold | restart | interval *<2-86400>* **| timeout** *<10-86400>* |	Configure Dead Peer Detection (DPD). This is a method of detecting a dead Internet Key Exchange (IKE) peer. This method uses IPsec traffic patterns to minimize the number of messages required to confirm the availability of a peer. DPD is used to reclaim the lost resources in case a peer is found dead. • **Clear**—terminate the VPN connection over the detection timeout. You must manually re-initiate the VPN connection. We recommend that you use Clear when the remote peer uses dynamic IP address. • **Hold**—traffic from your local network to the remote network can trigger the routerto re-initiate the VPN connection over the detection timeout. We recommend that you use Hold when the remote peer uses a static IP address • **Restart**—re-initiate the VPN connection for three times over the detection timeout. Default Action is Hold Interval is 30 seconds Timeout is 120 seconds
ike-version ike | ikev1 | ikev2 |	Configure the IKE version. IKE uses IKEv2 but switches to IKEv1 depending on the peer. Default is IKEv2
lifetime *<30-86400>* |	Configure the connection keep alive timer. Range is 30 to 86400 Default is 3600 seconds
proposal [dh-group 2 | 5 | 14 | 15 | 16 | 17 | 18 | 19 | 20 | 21 | 22 | 23 | 24 | 25 | 26] | [encryption 3des | aes128 | aes128gcm128 | aes256 | aes256gcm256 |	Configure the IKE/ESP proposal. Dh-default is 2 Encryption default is aes256 Hash default is SHA1
Command Modes	Perle(config-ike)#

Usage Guidelines

Use this command to configure IKE parameters.

Examples

Configures dead peer detection to restart.

Perle(config-ike)# dpd action restart

ip access-list

ip access-list {**extended** *<100-199>* \| *<2000-2699>* \|
resequence extended *<100-199><1-65535>* \| *<2000-2699> <1-65535>*] \|
standard *<1-99>* \| *<1300-1999>*}

Use the no form of this command to negate enable.

Syntax Description	**ip access-list**
{**extended** *<100-199>* | *<2000-2699>* |	Configure an IP access list number. See *(config-ext-nacl)*

resequence extended *<100-199><1-65535> | <2000-2699> <1-65535>* | | **standard** *<1-99> <1-65535> <1300-1999> <1-65535>* |	Configure resequence IP Access list. Entries are numbered sequentially, starting from 10 and in intervals of 10.
standard *<1-99> | <1300-1999>*}	Configure an IP access list number. See *(config-std-nacl)*
Command Modes	Perle(config)#ip access-list

Usage Guidelines

Use IP Access Control Lists (ACLs) to define rules for controlling the network traffic and reducing network attacks. You can filter traffic based on sets of rules defined for the incoming traffic or outgoing traffic. Access lists look from the top list entry to bottom list entry.. Be sure when creating access lists that the most important entries are at the top of the list.

Examples

Displays ACL definitions. You will note that there is no available space to add an entry within this list. Using the resequence command you can resequence these ACL entries.

Standard IP access list Moo.

10 deny host 1.1.1.1

20 deny host 2.2.2.2

30 permit 3.3.3.3

40 permit 4.4.4.4

To resequence this ACL list to start at 20 and then resequence each entry by 20's use:

Perle(config)#ip access-list resequence Moo 20 20

Standard IP access list Moo.

   20 deny host 1.1.1.1

   40 deny host 2.2.2.2

   60 permit 3.3.3.3

   80 permit 4.4.4.4

You now have space between the entries to add entries.

Note: Resequence numbering is lost on a reboot, therefore you must copy running-config to startup-config for these changes to be permanently saved.

Command Modes	Perle(config-std-nacl)#

Usage Guidelines

Configure packets to reject or accept.

Examples

This example permits packets from this host.

Perle(config-std-nacl)#permit host 172.16.77.88

(config-ext-nacl)

{*<1-65535>* | {**deny ip | permit ip** *<A.B.C.D>/hostname> <A.B.C.D>/hostname>* | **any** | **host** *<A.B.C.D>/hostname>*}

Use the no form of this command to negate a command or set to defaults.

Syntax Description	(config-ext-nacl)
{*<1-65535>*	{**deny ip	permit ip** *<A.B.C.D>/ hostname> <A.B.C.D>/ hostname>*	**any**	**host** *<A.B.C.D>/hostname>*}	Configure sequence numbers and permits or denies packets.
Command Modes	Perle(config-ext-nacl)#

Usage Guidelines

Configure sequence number and define packets to permit or deny.

Examples

This example permits packets from source host 172.16.77.88 and destination host any (host).

Perle(config-ext-nacl)#permit ip host 172.16.77.88 any

ip alg

ip alg

{**modules ftp | gre | h323 | nfs | pptp | sip | sqlnet | tftp | disable**}

Use the no form of this command to negate a command or set to defaults.

Syntax Description	**ip alg**
{**alg modules ftp | gre | h323 | nfs | pptp | sip | sqlnet | tftp | disable**}	Configure Application Level Gateway (ALG) modules. **Some parameters may not be available on some firmware versions or models.**
Command Modes	Perle(config)#ip alg

Usage Guidelines

Use this command to configure client applications to communicate with known ports used by server applications. ALG allows customized NAT traversal filters to be plugged into the gateway to support address and port translation for protocols such as FTP, BitTorrent, SIP, RTSP, and file transfer etc. In order for these protocols to work through NAT or a firewall, either the application has to know about an address/port number combination that allows incoming packets, or the NAT has to monitor the control traffic and open up port mappings (firewall pinhole) dynamically as required. Application data is passed through the security checks of the firewall or NAT that would have otherwise been restricted. Without an ALG, the ports would either get blocked, or the network administrator would need to open up a large number of ports in the firewall, weakening the network and allowing potential attacks on those ports.

By default all alg modules are enabled.

Examples

This example disables ALG module ftp.

Perle(config)#no ip alg modules ftp disable

ip as-path

ip as-path

{**access-list** *<WORD> <1-65535>* **deny \| permit** *<LINE>*}

Use the no form of this command to negate a command or set to defaults.

Syntax Description	**ip as-path**
{**as-path access-list** *<WORD> <1-65535>* **deny | permit** *<LINE>*}	Configure access list parameters.
Command Modes	Perle(config)#ip as-path

Usage Guidelines

Use this command to configure an access-list filters for Border Gateway Protocol (BGP) autonomous system (AS) numbers. You can use AS Path filters, either inbound or outbound, to filter either the routes you send or the routes you receive, respectively. You must apply these filters to each peer separately. Regular expressions are strings of special characters used to search and find character patterns.

Regular expression for *<LINE>* include:

CHAR	USAGE
^	Start of string
$	End of string
[]	Range of characters
-	Used to specify range (i.e [0-9])
( )	Logical Grouping
.	Any single character
*	Zero or more instances
+	On or more instance
?	Zero or more instance

Expression	Meaning
.*	Anything
^$	Locally originated routes
^100_	Learned from AS 100
_100$	Originated in AS 100
_100_	Any instance of AS 100
^[0-9]+$	Directly connected ASes

Examples

This example accepts prefixes that originated in AS 3299, all other prefixes won't be permitted.

Perle(config)#ip as-path access-list 1 permit ^3299$

Related Commands

(config-remote-mgmt)

show ip as-path-access-list

ip community-list

ip community-list

{**expanded** *<100-500> <1-65535>* **deny** *<LINE>* | **permit** *<LINE>* |
standard *<1-99> <1-65535>* **deny** *<1-4294967295>* | **internet** | **local-as** |**no-advertise** | **no-export** | **permit** *<1-4294967295>* | **internet** | **local-as** | **no-advertise** | **no-export** | **permit** *<LINE>*}

Use the no form of this command to negate a command or set to defaults.

Syntax Description	ip community-list
{**expanded** *<100-500> <1-65535>* **deny** *<LINE>*	**permit** *<LINE>*		Configure an extended community list.You can configure up to 32 communities.

standard *<1-99> <1-65535>* **deny** *<1-4294967295>* **| internet | local-as |no-advertise | no-export | permit** *<1-4294967295>* **| internet | local-as | no-advertise | no-export | permit** *<LINE>*	Configure a standard community list. You can configure up to 16 communities.
Command Modes	Perle(config)#ip community-list

Usage Guidelines

Use this command to configure a BGP community list and to control which routes are permitted or denied based on their community values.

Standard community lists are used to configure well-known communities and specific community numbers. You can pick more than one of the optional community keywords.

Expanded community lists are used to filter communities using a regular expression. Regular expressions are used to configure patterns to match community attributes

CHAR	USAGE
^	Start of string
$	End of string
[]	Range of characters
-	Used to specify range (i.e [0-9])
( )	Logical Grouping
.	Any single character
*	Zero or more instances
+	On or more instance
?	Zero or more instance

Expression	Meaning
.*	Anything
^$	Locally originated routes
^100_	Learned from AS 100
_100$	Originated in AS 100
_100_	Any instance of AS 100
^[0-9]+$	Directly connected ASes

Examples

This example configures a standard community list that denies routes that carry communities from network 40 in autonomous system 65540 and from network 60 in autonomous system 65550. This example shows a logical AND condition; all community values must match in order for the list to be processed.

Perle(config)#ip community-list standard test1 deny 65540:40 65550:60

Command Modes	Perle(config-fw-rules)#

Usage Guidelines

Use this command to create firewalls filter packets on interfaces.

There are two steps to create a firewall.

1. You define a firewall instance and save it under a name. A firewall instance is also called a firewall rule set, where a rule set is just a series of firewall rules. You define the firewall instance and configure the rules for its rule set in the firewall configuration node.

2 After defining the instance and specifying the rules in the rule set, you apply the instance to an interface or a zone. You do this by configuring the interface configuration node for the interface or zone. Once the instance is applied to the interface or zone, the rules in the instance begin filtering packets.

Examples

The example below applies firewall name set test to the inbound traffic on BV1 (bridging eth1 and eth2). This firewall drops all ICMP traffic (generated by ping commands), but allows all other traffic such as TCP Web traffic) because the default action is accept.

Perle(config)#ip firewall test
Perle(config-fw)#default-action accept
Perle(config-fw)#rule 1
Perle(config-fw-rules)#set action drop
Perle(config-fw-rules)#match protocol icmp

Perle(config-fw)#rule 2
Perle(config-fw-rules)#set action accept
Perle(config-fw-rules)#match protocol tcp
Perle(config)#interface ethernet 1
Perle(config)#bridge-group 1
Perle(config)#interface ethernet 2
Perle(config)#bridge-group 1

ip ftp

{**ftp passive | password 0** *<LINE>* | **7** *<WORD>* | *<LINE>* | **username** *<WORD>*}

Use the no form of this command to negate a command or set to defaults.

Syntax Description   **ip ftp**

{**ftp passive** | **password 0** *<LINE>* | **7** *<WORD>* | *<LINE>* | **username** *<WORD>*}	Configure File Transfer Protocol (FTP) parameters.
	Passive—indicates to the server that the client is opening the file transfer session. This option is used if the client is behind a firewall.
Command Modes	Perle(config)#ip ftp

Usage Guidelines

Use this command to configure File Transfer Protocol (FTP) parameters.

Examples

This example set username to labuser.

Perle(config)#ip ftp username labuser

ip health

ip health

{**profile** *<WORD>* }

Use the no form of this command to negate a command or set to defaults.

Syntax Description	**ip health**
{**profile** *<WORD>*}	Configure an IP Health Profile. See *(config-health-prof)* for more information.
Command Modes	Perle(config)#ip health

Usage Guidelines

Use this command to create a health profile. Health profiles are assigned to interfaces to monitor the heath of that interface.

Examples

This example creates a health profile called labhealth.

Perle(config)#ip health profile labhealth

Related Commands

(config-health-prof)

Use the no form of this command to negate a command or set to defaults.

Syntax Description	**(config-health-prof)**

{**failure-count** *<1-10>* | **success-count** | **test target** *<hostname | <A.B.C.D>* | **type ping response-timeout** *<1-30>* | **traceroute limit** *<1-254>*}	Test *<1–100>*—Prioritize heath test 1=first. • Failure test count before marking failed • Count failure before marking as failed • Count successes before marking as active • Configure a health test
Command Modes	Perle(config-health-prof)#

Usage Guidelines

Use this command to configure health tests.

Examples

This example creates a health test to ping host 172.16.77.4 10 times

Perle(config-health-prof)#test target 10 172.16.77.4

ip host

ip host

{**host** *<WORD> <A.B.C.D>*}

Use the no form of this command to negate a command or set to defaults.

Syntax Description	**ip host**
{**host** *<WORD> <A.B.C.D>*}	Configure a host to add to the host table.
Command Modes	Perle(config)#ip host

Usage Guidelines

Use this command to add a host to the router internal host table.

Examples

This example adds host labhost with ip address of 172.16.99.10 to the host table.

Perle(config)#ip host labhost 172.16.99.10

Related Commands

show hosts

ip host-group

ip host-group

{**host** *<WORD>*}

Use the no form of this command to negate a command or set to defaults.

Syntax Description	**ip host-group**

{**host** *<WORD>*}	Configure the host group name.
Command Modes	Perle(config)#ip host

Usage Guidelines

Use this command to create a host group. A host group is a list of hosts.

Examples

This example creates host group hosts_for_labs.

Perle(config)#ip host-group hosts_for_labs

Related Commands

(config-host-group)

(config-host-group)

{**host** *<A.B.C.D>* | *<WORD>* | *<X:X:X:X::X>*}

session-idle-timeout *<1-1440>*}	Configure a HTTP server session idle timeout. Default session idle timeout is 1440 seconds.
Command Modes	Perle(config)#ip http

Usage Guidelines

Use this command to configure HTTP/S server parameters.

Examples

This example enables HTTP secure server.

Perle(config)#ip http secure-server

Related Commands

show ip http

ip name-server

ip name-server

{**name-server** *<A.B.C.D>*}

Use the no form of this command to negate a command or set to defaults.

Syntax Description	ip name-server
{**name-server** *<A.B.C.D>*}	Configure the address of the name server.

Command Modes	Perle(config)#ip name-server

Usage Guidelines

Use this command to configure the nameserver. Nameserver is a server that handles queries regarding the location of a domain name's various services such as website, emails and so on. It is also a part of the Domain Name System (DNS) which maintains a directory of domain names and translate them to IP addresses. When you visit a domain, a DNS lookup first checks its name servers and reviews the DNS records for that domain accordingly.

Examples

This example set name-server to 172.16.44.55.

Perle(config)#ip name-server 172.16.44.55

ip nat

{**nat [inside source any | list** *<1-199>* **interface bvi** *<1-9999>* **| cellular** *<0-0>* **| dialer** *<0-15>* **| dot11radio** *<0-4>* **| ethernet** *<1-5>* **| openvpn** *<0-999>* **| tunnel** *<0-999>* **| over load | no-strict] | static [ip** *<A.B.C.D>* **| local-pool** *<WORD>* **global-pool** *<WORD>* **[address-mapping persistent | random] inbound-interface bvi** *<1-9999>* **| cellular** *<0-0>* **| dialer** *<0-15>* **| dot11radio** *<0-4>* **| ethernet** *<1-5>* **| openvpn** *<0-999>* **| tunnel** *<0-999>* *<1-65535>* *<A.B.C.D>* *<A.B.C.D>* **| tcp | tcp+udp | udp]** *<A.B.C.D>* *<1-65535>* **inbound-interface bvi** *<1-9999>* **| cellular** *<0-0>* **| dialer** *<0-15>* **| dot11radio** *<0-4>* **| ethernet** *<1-5>* **| openvpn** *<0-999>* **| tunnel** *<0-999>* *<1-65535>* *<A.B.C.D>* *<A.B.C.D>* **|**

pool *<WORD>* *<A.B.C.D>* *<A.B.C.D>* **netmask** *<A.B.C.D>*}

Use the no form of this command to negate a command or set to defaults.

Syntax Description	ip nat

{nat [inside source any | list *<1-199>* **interface bvi** *<1-9999>* **| cellular** *<0-0>* **| dialer** *<0-15>* **| dot11radio** *<0-4>* **| ethernet** *<1-5>* **| openvpn** *<0-999>* **| tunnel** *<0-999>* **| over load | no-strict] | static [ip** *<A.B.C.D>* **| local-pool** *<WORD>* **global-pool** *<WORD>* **[address-mapping persistent | random] inbound-interface bvi** *<1-9999>* **| cellular** *<0-0>* **| dialer** *<0-15>* **| dot11radio** *<0-4>* **| ethernet** *<1-5>* **| openvpn** *<0-999>* **| tunnel** *<0-999>* *<1-65535>* *<A.B.C.D>* *<A.B.C.D>* **| tcp | tcp+udp | udp]** *<A.B.C.D>* *<1-65535>* **inbound-interface bvi** *<1-9999>* **| cellular** *<0-0>* **| dialer** *<0-15>* **| dot11radio** *<0-4>* **| ethernet** *<1-5>* **| openvpn** *<0-999>* **| tunnel** *<0-999>* *<1-65535>* *<A.B.C.D>* *<A.B.C.D>* **|**	Configure Network Address Translation (NAT). **Address mapping** **Random mode**–translation address is computed based on source and destination addresses of incoming packets on every connection **Persistent mode**–translation address is computed based on source address of incoming packets on the first connection, and will be persistent for each connection there after Default translation mode is random **Global pool–**define the global pool **Local pool–**define the local pool **Note:** Global address pools cannot have overlapping addresses between multiple pools **No**—strict–do not turn on firewall to drop invalid connections
pool *<WORD>* *<A.B.C.D>* *<A.B.C.D>* **netmask** *<A.B.C.D>***}**	Define DHCP address pool.

Command Modes	Perle(config)#ip nat

Usage Guidelines

One to One:

Use Source Network Address Translation (SNAT) to allow multiple host inside the network to reach a host outside the network.

One to Many:

Use Destination Address Translation (DNAT) to allow multiple hosts outside the network to reach a single host inside the network.

Examples

This example allows all local traffic to the Internet through ethernet port 1.

First you need to create an access-list, then you need to assign NAT.

Perle(config)#ip access-list standard 1

Perle(config-std-nacl)#permit any

Perle(config)#ip nat inside source list 1 interface ethernet 1 overload

Related Commands
show ip nat

ip passthrough

ip passthrough {**enable | interface ethernet address** *<A.B.C.D>* **| hardware-address** *<HEX-STRING.>*}

Use the no form of this command to negate or set to defaults.

Syntax Description	ip passthrough
{**enable | interface ethernet address** *<A.B.C.D>* **| hardware-address** *<HEX-STRING.>*}	Enables IP passthrough.Your router's default IP address for IP passthrough is 192.168.0.1.
Command Modes	Perle(config)#ip passthrough

Usage Guidelines

Use this command so your attached device can access and administer the router until the LTE connection is established. In this mode, you can configure the LTE parameters for your connection. Once your LTE connection is established, the IP address of the attached device is the IP address obtained from the LTE network.

Examples

This example enables IP passthrough with user specified IP address 192.168.1.1.

Perle(config)#ip passthrough interface ethernet address 192.168.1.1

Perle(config)#ip passthrough enable

ip prefix-list

ip prefix-list

{*<WORD>* **deny** *<A.B.C.D> </n | A.B.C.D>* **ge | le** *<1-32>* **| description** *<LINE>* **| permit** *<A.B.C.D> </n | A.B.C.D>* **ge | le** *<1-32>* **| seq <1-65535> deny** *<A.B.C.D> </n | A.B.C.D>* **ge | le** *<1-32>* **| permit** *<A.B.C.D> </n | A.B.C.D>* **ge | le** *<1-32>*}

Use the no form of this command to negate or set to defaults.

Syntax Description	ip prefix-list
{*<WORD>* **deny** *<A.B.C.D> </ n	A.B.C.D>* **ge	le** *<1-32>* **| description** *<LINE>* **| permit** *<A.B.C.D> </n	A.B.C.D>* **ge	le** *<1-32>* **| seq <1-65535> deny** *<A.B.C.D> </n	A.B.C.D>* **ge	le** *<1-32>* **| permit** *<A.B.C.D> </n	A.B.C.D>* **ge	le** *<1-32>*}	Configure prefix-list filter. **ge value** (optional) Specifies a prefix length greater than or equal to the value. It is the lowest value of a range of the length (the "from" portion of the length range) **le value** (optional) Specifiers a prefix length less then or equal to the value. It is the highest value of a range of the length (the "to" portion of the length range.
Command Modes	Perle(config)#ip prefix-list

Usage Guidelines

Use this command to create prefix lists Prefix lists are used in route maps and route filtering operations.The can be used as an alternative to access lists in many routing filtering commands. The most important difference is that a prefix-list allows you to filter networks based on their subnet mask.

Examples

This example shows how to accept a mask length of up to 24 bits in routes with the prefix 172.20.10.171/16.

Perle(config)#ip prefix list1 permit 172.20.10.171 /16 le 24

This example shows how to permit the prefix 172.17.0.0/16.

Perle(config)#ip prefix list2 permit 172.17.0.0 255.255.0.0

Command Modes	Perle(config-pbr-rules)#

Usage Guidelines

Use these commands to set policy rules.

Examples

This example sets the action for the packets that match defined rule.

Perle(config-prb-rules)# set action drop

This example uses policy-based routing to route all HTTP traffic protocol tcp, destination port 80 through a policy route called http-firewall.

Perle(config)# ip route 0.0.0.0 0.0.0.0 10.10.200.9
Perle(config)#i p route table 2 0.0.0.0 0.0.0.0 172.16.0.8

Perle(config-prb)# ip route-policy http-firewall
Perle(config-prb))# rule 2
Perle(config-prb-rules)# set routing-table 2
Perle(config-prb-rules)# match protocol tcp
Perle(config-prb-rules)# match destination port 80

Perle(config)# interface ethernet 1
Perle(config-if)# ip address 192.168.2.1 255.255.255.0
Perle(config-if)# ip policy route-policy http-firewall

ip scp

ip scp

{**password 0** *<LINE>* | **7** *<WORD>* | *<LINE>* | **username** *<WORD>*}

Use the no form of this command to negate or set to defaults.

Syntax Description	ip scp
{**scp password 0** *<LINE>*	**7** *<WORD>*	*<LINE>*	**username** *<WORD>*}	Configure SCP password and username.
Command Modes	Perle(config)#ip scp

Usage Guidelines

Use this command to configure the username and password to enable the router to securely copy files from a remote workstation.

Examples

This example configures the username for a connection to a remote host.

Perle(config)#ip scp username lynlab

ip sftp

ip sftp

{**username** *<WORD>* | **password** **<0** *<LINE>* | **7** *<LINE>* | *<LINE>*}

Use the no form of this command to negate or set to defaults.

Syntax Description	ip sftp

{**username** *<WORD>* | **password <0** *<LINE>* | 7 *<LINE>* | *<LINE>*}	SFTP configuration commands.

Command Modes	Perle(config)#ip stfp

Usage Guidelines

Use this command to create a SFTP secure connection to a remote host.

Examples

This example configures a username fred.

Perle(config)#ip sftp username fred

time-out *<120>*	Configure SSH login time out interval. Values are 1 to 120 seconds. Default is 20 seconds
Command Modes	Perle(config)#ip ssh

Usage Guidelines

The SSH protocol enables you to set up SSH connections. Yourrouter supports both client and server modes.

Examples

This example sets server mode for encryption hmac-md5.

Perle(config)#ip ssh server algorithm mac hmac-md5

show ssh

ip tacacs

ip tacacs

{**tacacs source-interface bvi** *<1-9999>* \| **cellular** *<0-0>* \| **dialer** *<0-15>* \|**dot11radio***<0-4>* \| **ethernet** *<1-5>* **.** *<1-4000>* \| **openvpn-tunnel** *<0-999>* \| **tunnel** *<0-999>*}

Use the no form of this command to negate or set to defaults.

Syntax Description	**ip tacacs**
{**tacacs source-interface bvi** *<0-9999>* | **cellular** *<0-0>* | **dialer** *<0-15>* | **dot11radio***<0-4>* | **ethernet** *<1-5>* **.** *<1-4000>* | **openvpn-tunnel** *<0-999>* | **tunnel** *<0-999>*}	Configure the source interface for TACACS+ requests.

Command Modes	Perle(config)#ip tacacs

Usage Guidelines

Use this command to configure for Terminal Access Controller Access Control System (TACACS+) authentication.

Examples

This example configures the source-interface as ethernet 1

Perle(config)#ip tacacs source-interface ethernet 1

Related Commands

clear tacacs

tacacs

ip telnet

ip telnet

{**server**}

Use the no form of this command to negate or set to defaults.

Syntax Description	ip telnet
{**server**}	Enables Telnet server.

Command Modes	Perle(config)#ip telnet

Usage Guidelines

Use this command to config Telnet as the protocol to use for connections to a host. Telnet allows a user at one site to establish a TCP connection to a login server at another site and then pass the keystrokes from one device to the other.

Examples

This example enables telnet server.

Perle(config)#ip telnet server

Syntax Description	(config-rtr)-RIP
{**aggregate-address** *<A.B.C.D>* *<A.B.C.D>* **as-set summary-only**		Specifies the block of addresses to be aggregated. **as-set**—specifies that the routes resulting from the aggregation include the AS-set. **summary-only**—specifies that aggregated routes are summarized. These routes will not be advertised.
exit-address-family		Exit family level menu.
maximum-path *<1-255>*	**ibgp** *<1-255>*		Configure the maximum number of eBGP/iBGP paths to a destination. ebgp values are 1 to 255. Default is 1. ibgp values are 1 to 255. Default is 1.

neighbour *<A.B.C.D>* *<X:X:X:X::X>* **advertisement-interval** *<0-600>* | **allowas-in** *<1-10>* | **[asoverride]** | **[attribute-unchanged as-path** | **med** | **next-hop]** | **[capability dynamic** | **orf prefix-list both** | **receive** | **send]** | **[default originate route-map** *<NAME>*] | **[description** *<LINE>*] | **[disable-connected-check** | **[distributed-list** *<1-99>* **in** | **out** *<1300-2699>* **in** | **out]** | **[dont't-capability-negotiate]** | **[ebgp-multihop** *<1-255>*] | **[filter-list** *<WORD>*] | **[local-as** *<1-4294967295>* **no-prepend]** | **[maximum-prefix** *<1-4294967295>*] | **[next-hop-self]** | **[override-capability]** |**[passive]** | **[password**	Configure neighbor configuration. **neighbor address**—specify an IPv4 or IPv6 address. **advertisement-interval**—configure the minimum interval between sending BGP routing updates. Values 0 to 600 Default eBGP is 30 secs Default iBGP peers is 5 seconds **allowas-in**—allows or disallows receiving BGP advertisements containing the AS path of the local router. Default readvertisement is disabled. Default is 3 **as-override**—override ASN's in outbound updates if AS–path equals remote–AS. Only applies to eBGP neighbor. Default is disable

<LINE>| [port *<1-65535>*] | [prefix-list *<WORD>*] | [remote-as *<1-4294967295>*] | remove-private-as | [route-map *<WORD>* in | out] | [route-reflector -client] | [route-server-client] | [send-community both | extended | standard] | [shutdown] | [soft-reconfiguration] | [strict-capability-match] | [timers *<0-65535> <0-65535>* | connect *<0-65335>*] | [ttl-security] | [unsuppress-map *<WORD>*] |

attribute-unchange—allows the router to send updates to a neighbor with unchanged attributes.
Value is on for all if no option provided
Default is disabled

capability—advertise dynamic capability to this neighbor.

Default is session is brought up with minimal capability on both sides

capability orf prefix-list [both | receive | send]—advertises support for Outbound Route Filtering (OFR) for updating BGP capabilities advertised and received from this neighbor.
Default is the session is brought up with minimal capability on both sides.

default-originate—enables or disables forwarding of the default route to a BGP neighbor.

Default is disabled

Description—provide a description for a BGP neighbor.

disable-connected-check—Enables a directly connected eBGP neighbor to peer using a loopback address without adjusting the default TTL of 1.

Default is off

distributed-list—applies an access list to filter inbound/outbound routing updates from this neighbor.
Default is none

dont' capability-negotiate—disables BGP capability negotiation
Default is capability negotiation is performed.

ebgp-mulihop—Allows you to establish eBGP peer relationships between routers that aren't directly connected to one another.
Default is only directly connected neighbors are allowed

filter-list—applies an AS–path list to routing updates to this neighbor
Default is none

local-as—defines a local autonomous system number for eBGP peering
Default is none

maximum-prefixes—configure the maximum number of prefixes to accept from this neighbor before that neighbor is taken down.
Values are 1–4294967295
Default is none

next-hop-self—sets the local router as the next ho for this neighbor
Default is disable

over-ride-capability—overrides capability negotiation to allow a peering session to be established with a neighbor that does not support capabilities negotiation
Default is a session cant be established if the neighbor does not support capability negotiation

passive—directs the router not to initiate connections with this neighbor

password—Configure a BGP MD5 password
Default is none

port—specifies the port on which the neighbor is listening for BGP signals
Values are 1 to 65535
Default port is 179

prefix-list- applies this prefix list filter updates to/from this neighbor
Default is none

remote-as—Configure the autonomous system number of the neighbor.
Default is none

remove-private-as—directs the router to remove private AS numbers from updates sent to this neighbor (eBGP only)
Default is disable (do not remove)

route-map—applies a route map to filter updates to/from this neighbor
Default is none

route-reflector—specify this neighbor as a route reflector client (iBGP only)
Default is disabled

route-server-client—specify this neighbor as a route server client
Default is disable

send-community—enables or disables the sending of community attributes to the specified neighbor

Value— no type specified send standard attributes
Default is both

shutdown—administratively shuts down a BGP neighbor
Default is disabled

soft-reconfiguration—directs the router to store received routing updates

strict-capability-match—directs the router to strictly match the capabilities of the neighbor
Default is disable

timers—
keepalive interval
Values are 0–-65535
Default is 60 seconds

holdtime

Value are 0-65535
Default is 180 seconds

connect
Values are 0-65535
Default is 120 seconds

ttl-security—Configure the time-to-live (ttl) security hop count. This option and ebgp-multihop cannot be set at the same time
Values are 1 to 254 hops
Default is 1

unsupress-map—directs the router to selectively advertise routes suppressed by aggregating addresses, based on a route map

Value specify a router map
Default is none

update-source—specifies the source ip address or interface for routing updates
Default is none

	weight—defines a default weight for routes from this neighbor Values are 1-65335 Default is routes learned from a BGP neighbor have a weight of 0. Routes sourced by the local router have a weight of 32768
network *<A.B.C.D>* **backdoor | mask** *<A.B.C.D>* **| route-map** *<WORD>*}	Configure a network to be advertised by the BGP routing process. **Backdoor**—indicates that this network is reachable by a back door rote. A back door network is considered to be like a local network but is not advertised. **Route-map**—specifies a configured route map to be used when advertising the network Default is none

key

key

{**chain** *<WORD>*}

Use the no form of this command to negate a command or set to defaults.

Syntax Description	**key**
{**chain** *<WORD>*}	Configure keychain management.

Command Modes	Perle(config)#key

Usage Guidelines

Use this command to create a key chain. Key chain management allows you to create and maintain key chains, which are sequences of keys (sometimes called shared secrets). You can use key chains with features that secure communications with other devices by using key-based authentication.

Examples

This example create key chain 1, then go into sub menu key.

Perle(config)#key chain key1

Related Commands

user-attribute other *<WORD>* | **samaccountname** | **uid**}

Use the no form of this command to negate a command or set to defaults.

Syntax Description	**(config-ldap-server)**
{**base-dn** *<WORD>*		Configure the Base DN for LDAP. The Base DN is the starting point an LDAP server uses when searching for user authentication within your Directory.
bind authenticate root-dn *<WORD>* **password 0** *<WORD>*	**7** *<WORD>*	*<WORD>*		Configure • An authenticated bind is performed when a root distinguished name (DN) and password are available • In the absence of a root DN and password, an anonymous bind is performed

ipv4 *<WORD>	<A.B.C.D>* |	Configure the IPv4 address of LDAP server.
ipv6 *<WORD>	<X:X:X:X::X>* |	Configure the IPv6 address of LDAP server.
mode secure |	Set the server mode. ● secure – configures the LDAP to initiate the transport layer security (TLS) connection and specifies the secure mode ● non-secure Default is non-secure
search-filter *<WORD>* |	Configure a search filter The search filter operation must be supported on the LDAP server. Filters are to restrict the numbers of users or groups that are permitted to access an application. In essence, the filter limits what part of the LDAP tree the application syncs from. A filter can and should be written for both user and group membership. This ensures that you are not flooding your application with users and groups that do not need access.
**secure cipher	transport port** *<1-65535>* **| trustpoint** *<WORD>* |	Configure ● ciphers—adh, dh, dss, edh, high, medium, rsa, sslv3 ● transport—listening port for secure connections ● trustpoint Default listening port for secure transfer connections is 636
timeout retransmission *<1-65535>* |	Configure the timeout for retransmissions. Values are 1 to 65535 Default is 30 seconds
transport port *<1-65535>*	Configure the listening port for unsecured connections. Default port is 389
user-attribute other *<WORD>* **| samaccountname	uid**}	Configure the user attribute. ● other—configure custom usr attribute ● sAMAccountName— Microsoft Active Directory ● uid—OpenLDAP
Command Modes	Perle(config-ldap-server)#

Usage Guidelines

Use this command to configure LDAP server parameters.

Examples

Search filter for LDAP

For example, if your users are distinguished by having two objectClass attributes (one equal to 'person' and another to 'user'), this is the command to match for it.
Perle(config-ldap-server) #search-filter (&(objectClass=person)(objectClass=user))

Search filter for Microsoft Active Directory

This only synchronize users in the 'Warehouse' group—this should be applied to the User Object Filter:

Perle(config-ldap-server) #search-filter (&(objectCategory=Person)(sAMAccountName=*)(memberOf=cn=CaptainPlanet,ou=users,dc=company,dc=com))

run |
timer |
tvl-select mac-phy-cfg| managemnt-address *<A.B.C.D>* | *<X:X:X:X:X>*| **max-frame-size | port-description | system capabilities | system description | system-name** |
tx-delay}

Syntax Description	lldp
{**hold-mult** *<2-10>*		Configure a value for the LLDP hold multiplier. This is the time to cache learned LLDP information before discarding, measured in multiples of the timer parameter.
	For example, if the Timer is 30 seconds, and the Hold Multiplier is 4, then the LLDP packets are discarded after 120 seconds. Default is 4 Values are 2 to 10
logging		Configure logging for LLDP neighbor discovery. Default is off.
notification-interval		Configure the minimum interval between LLDP SNMP notifications. Default is 5 seconds Value is 5 to 3600 seconds
optional-tlv port-info		Reverts to the previous setting of providing the interface name.

reinit *<1-10>* |	Configure the delay (in sec) for LLDP initializations on any interface. Default is 2 seconds Values are 1 to 10 seconds
run |	Enables LLDP. LLDP Disabled by default.
timer |	Configure the rate at which LLDP packets are sent. This parameter is used with the TX Hold multiplier parameter to determine when LLDP packets are discarded. Default is 30 seconds Values are 5 to 32768 seconds
tvl-select mac-phy-cfg | **managemnt-address** *<A.B.C.D>* | *<X:X:X:X:X>* | **max-frame-size** | **port-description** | **system capabilities** | **system description** | **system-name** |	Configure the LLDP TLVs to send. Default is all TLVs are sent. Maximum management addresses are 8. Default management addressees are automatically selected by LLDP.
tx-delay}	Configure the amount of time in seconds that passes between successive LLDP frame transmissions due to changes in the LLDP local systems MIB. Default is 30 seconds Values are 1 to 8192 seconds
Command Modes	Perle(config)#lldp

Usage Guidelines

Use this command to configure Link Layer Discovery Protocol (LLDP) parameters., LLDP allows network devices to advertise their identity and capabilities on a LAN. LLDP specifically defines a standard method for Ethernet network devices such as switches, routers, and wireless LAN access points to advertise information about themselves to other nodes on the network and store the information they discover. LLDP should be enabled in a multi-vendor network.

Examples

This example enables LLDP.
Perle(config)#lldp run

Use the no form of this command to negate a command or set to defaults.

Syntax Description	mac access-list
{**access-list** *<WORD>* |	Configure a MAC access list name.
export *<WORD>* **url flash:** | **ftp:** | **http:** | **https:** | **scp:** | **sftp:** | **tftp:** |	Exports MAC access list to a server.
import *<WORD>* **interface bvi** *<1-9999>* | **dot11radio** *<1-4>* |**ethernet** *<1-5>* . *<1-4000>* | **url flash:** | **ftp:** | **http:** | **https:** | **scp:** | **stfp:** | **tftp:**}	Import formats are; • xxxx.xxxx.xxxx—Cisco format where xxxx is 1-4 digits • xx:xx:xx:xx:xx:xx—where xx is 1-2 digits • aabbccddeeff • Import from supported interface • ethernet interfaces • sub-ethernet (VLANs) interfaces • dot11radio (SSID 0-4 in AP mode) • bridge interfaces

Command Default	Notes:
	• There are no defaults when configuring the MAC access-group and policy, but the no/default policy after initial configuration, is Disabled
	• No and default commands operate the same for all interface types
	• If there is no MAC access-group specified, the no/default command REMOVES the MAC access-group and policy
	• If a MAC access-group is specified the default policy: disabled is configured and applied
Command Modes	Perle(config)#mac

Usage Guidelines

Use this command to create a host MAC address list.

Policy descriptions
Permit—allow all MAC addresses in this MAC access list, deny all MAC addressees not in this list.
Deny—deny all MAC addresses in this MAC access list, allow all others not in the list

Disable—not active

MAC address list can also be created by importing CSV files.

Examples

This example assigns access-list eth1-macs to interface ethernet 1with all addresses within the eth1-macs policy to be accepted or permitted on this interface.

Perle(config)#interface ethernet 1
Perle(config)#mac-access-list eth1-macs-static
Perle(config-mac-acl)#

This example imports a <mac-list-csv.txt> file from host 172.16.4.182 using http protocol.

Perle(config)#mac access-list import <mac-list-csv.txt> url http://172.16.4.182/pub/<mac-list-csv.txt>

Connected to 172.16.4.182.

59 bytes copied in 0.009 seconds (6319 bytes/sec)

Waiting for download to complete . . .

% Successfully processed 4 properly formatted MAC addresses

This example exports a <mac-list-csv.txt> file tot 172.16.4.182 using tftp protocol.

Perle(config)#mac access-list export <mac-list-csv.txt> url tftp://172.16.4.182/<mac-list-csv.txt>

Accessing tftp://172.16.4.182//<macs-export-file>

60 bytes copied in 0.003 seconds (21030 bytes/sec)

This example imports and permits MAC addresses from BVI interface 10 into bridge-mac-list.

Perle(config)#mac access-list import bridge-mac-list interface bvi 10

Perle(config)#interface bvi 10

Perle(config-if)#mac access-group bridge-mac-list permit

management-access

management-access {**enable** | **from-lan** | **from-wan**}

Syntax Description	management-access
{**enable** |	Enables management access. Default is enabled
from-lan |	Enters the configuration menu for defining management access from the LAN.
from-wan |	Enters the configuration menu for defining management access from the WAN.
Command Default	LAN—all protocols enabled except SNMP WAN—all protocols are disabled.
Command Modes	Perle(config)#management-access

Usage Guidelines

Use this command to enter the configuration menu for the management access you wish to set.

With in the "from-LAN" and "from-WAN" sub menu, you will be able to enable/disable the following management access methods.

Management Methods are:

- Enable—All management Access methods for this interface
- HTTP—Enable HTTP (Web) management Access for this interface
- HTTPS—Enable HTTPS (Web) management access for this interface
- Telnet—Enable Telnet management access for this interface
- SSH—Enable SSH management access for this interface
- SNMP—Enable SNMP management access for this interface

nat66

{**prefix outside** *<X:X:X:X::X:X>*/*<0-128>* **any inside** *<X:X:X:X::X:X>*/*<0-128>* **outside-interface cellular** *<0-0>* \| **no-strict**}

Use the no form of this command to negate a command or set to defaults.

Syntax Description	**nat66**
{**prefix outside** *<X:X:X:X::X:X>*/*<0-128>* **any inside** *<X:X:X:X::X:X>*/*<0-128>* **outside-interface cellular** *<0-0>* | **no-strict**}	Configure parameters for NAT66.

Command Modes	Perle(config)# nat66

Usage Guidelines

Use this command to configure NAT66 parameters. In its simplest form, a NAT66 device is attached to two network links, one of which is an "internal" network link and the other of which is an "external" network with connectivity to the global Internet. All of the hosts on the internal network use addresses from a single, locally-routed prefix, and those addresses are translated to/from addresses in a globally-route-able prefix as IP packets transit the NAT66 device.

Examples

This example sets any outside packets with an IPv6 header of 2001:db8:0:2::/64 to be converted to an IPv6 header of 2001:db8:0:12::/64 on outbound interface cellular 0.

nat66 prefix outside 2001:db8:0:2::/64 inside 2001:db8:0:12::/64 outside-interface cellular 0

Related Commands

show nat66

999>] | [tunnel <0-999>] | [target <A.B.C.D> | <WORD> | <X:X:X:X::X>] |
[threshold-count <1-30>]}

Use the no form of this command to negate a command or set to defaults.

Syntax Description	(config-network-watchdog)
{**count** *<1-10>* | **enable** | **[fail-action notifications-only | notifications-reset]** | **interval** *<1-180>* | **response** *<1-3600>* | **source-interface [bvi** *<1-9999>*] | **[cellular** *<0-0>*] | **[dialer** *<0-15>*] | **[dot11radio** *<0-4>*] | **ethernet** *<1-14>*| **[open-tunnel** *<0-999>*] | **[tunnel** *<0-999>*] | **[target** *<A.B.C.D>* | *<WORD>* | *<X:X:X:X::X>*] | **[threshold-count** *<1-30>*]}	Configure parameters for network watchdog. **Fail-action** • notify only • notify and reboot **Interval** to wait between tests. Values are 1 to 180 minutes. Default modem is 10 minutes. Default: router is 20 minutes. **Interval** to wait between tests. Values are 1 to 180 minutes. Default modem is 10 minutes. Default router is 20 minutes. **Response**—Time to wait for a response to the ping request. Values are 1 to 3600 seconds. Default is 5 seconds. **Source-interface**—Specify the interface to send the ping request on (optional). Values are: • BVI 1–9999 • cellular 0–0 • dialer 1–15 • dot11radio 0–4 • ethernet *<1-5>* • openvpn 0–999 • tunnel 0–999 **Target**—Enter the target host IPv4, IPv6 or hostname address. **Threshold count**—The consecutive failed test count to trigger an Fail-action. Value is 1 to 30
Command Modes	Perle(config-network-watchdog)#

Usage Guidelines

Use this command to configure the Network Watchdog timeout action When configured, the watchdog feature runs continuous ping tests. Each ping test is be comprised of one or more ping attempts. If all of the pings in a test fail, the test has failed, if one ping test passes, the test is considered to have passed.

The watchdog feature is triggered after a successful connection, which is defined as one successful test. After which your tests will run as defined..

If any of the ping test fail, the router and modem notifies the user and/or can reset the router and modem.

Examples

This example configures the watchdog timer on Ethernet interface 2 to ping target host 172.16.1.1 with a count of 10.

Perle(config-network-watchdog)#count 10

Perle(config-network-watchdog)#target 172.16.1.1

Perle(config-network-watchdog)#source interface ethernet 2

version *<1-4>* |
trusted-key *1-65534*}

Use the no form of this command to negate a command or set to defaults.

Syntax Description	**ntp**
{**authentication**		Configure authentication of time sources. The time sources must authenticate with each other before synchronizing clock time.

authentication-key *<1-65534>* **md5 | sha1 | sha256 | sha512 |** *<WORD>* **0 | 7 |**	Configure the authentication key to be exchanged between time sources before clock synchronizing begins. 0—unencrypted key 7—encrypted key
broadcastdelay *<1-999999>* |	Configure the broadcast delay timer. By default, the router sets broadcast delay to Auto-negotiate. Select the auto-negotiate broadcast delay off if you wish to set your own broadcast delay time in microseconds. Broadcast delay time is the estimated round-trip delay between the broadcast NTP server and the router.
gnss |	Configure to use GNSS (GPS) as a time source.
logging |	Logs NTP messages to the router's internal log.
lte |	Configure to use LTE as a time source.
master *<1-15>* | **peer** *<A.B.C.D> <WORD> <X:X:X:X::X>* **ip** *<WORD>* **ipv6** *<WORD>>* | **key** *<1-65534>* | **maxpoll** *<4-17>* | **minpoll** *<4-17>* | **prefer** | **version** *<1-4>* |	Configure master or peer as the source clock. The stratum defines how far away the clock is away from the Authoritative Time Source. The highest stratum is 1. It is reserved for atomic clocks, GPS clocks or radio clock which generates a very accurate time. This type of time source is defined as the "Authoritative time source". The stratum defines how many hops a node is from the "authoritative time source". Stratum x nodes are synchronized to stratum x-1 nodes.Stratum numbers range from 1 to 15. Configure the IPv4/IPv6 address or hostname of the NTP peer that you are getting the clock from. Select prefer to use this NTP source over another.
	A preferred peer's responses are discarded only if they vary greatly from the other time sources. Otherwise, the preferred peer is used for synchronization without consideration of the other time sources.

server *<A.B.C.D> <WORD> <X:X:X:X::X>* **ip** *<WORD>* **ipv6** *<WORD>>* | **key** *<1-65534>* | **maxpoll** *<4-17>* | **minpoll** *<4-17>* | **prefer** | **version** *<1-4>* |	Configure the IPv4/IPv6 address or hostname of the NTP peer that you are getting the clock from. Select prefer to use this NTP source over another. A preferred server's responses are discarded only if they vary greatly from the other time sources. Otherwise, the preferred server is used for synchronization without consideration of the other time sources.
	Changes to the polling interval is not recommended and is discouraged. NTP dynamically selects the optimal poll interval between the values of minpoll and maxpoll, which defaults to 64 and 1024 seconds respectively and are correct for most environments.
	Shorter values are used to correct large errors and larger values are to refine accuracy.
	Default is minimum poll 64. Versions 1 to 4 are supported
trusted-key *1-65534*}	Configure a trusted key to be used for trusted time sources.

Command Modes	Perle(config)#ntp

Usage Guidelines

Use this command to distribute and maintain synchronization of time information between nodes in a network. NTP server uses UTC (Universal Coordinated Time). When initially launched, it can take NTP as much as 5 minutes to obtain an accurate time.This is due to the algorithm used to determine what NTP master(s) the router should synchronize with. NTP will not synchronize with nodes whose time is significantly off even if its stratum is lower. During this "settling" period, the router may not have the correct time. NTP can usually achieve time synchronization between two systems in the order of a few milliseconds. This is achieved with a time transmission rate of as little as one packet per minute.

Examples

Perle(config)#ntp server 172.16.4.181
```

policy-map

{*<WORD>* |
priority-queue *<WORD>* |
rate-control *<WORD>* **bandwidth** *<1-2000000>* |
traffic-limit *<1-2000000>*}

Use the no form of this command to negate a command or set to defaults.

Syntax Description	policy-map
{*<WORD>* |	Specifies the name of the policy map to be created or modified.
priority-queue *<WORD>*|	Configure priority-queue policy-map. See *(config-pmapPQ)*
rate-control *<WORD>* **bandwidth** *<1-2000000>* |	Configure rate-control policy-map. See *(config-pmapRC)*
traffic-limit *<1-2000000>*}	Configure traffic-limit policy-map. See (*(config-pmapTL)*
Command Modes	Perle(config)#policy-map

Usage Guidelines

Use this command to create a policy-map. A policy map references class maps and identifies a series of actions to perform based on the traffic match criteria. A policy map essentially defines a policy stating what happens to traffic that has been classified using class maps and ACLs.

Yourrouter provides you with three mechanisms for configuring Quality of Service (QOS).

1) Priority-queuing—packets are placed in queues, high priority packets are sent first.

2) Rate-control—rate control is a classless policy that limits the packet flow to a set rate. Traffic is filtered based on the expenditure of tokens. Tokens roughly correspond to bytes. Short bursts can be allowed to exceed the limit. On creation, the Rate-Control traffic is stocked with tokens which correspond to the amount of traffic that can be burst in one go. Tokens arrive at a steady rate, until the bucket is full.

3) Traffic-limiting—traffic limiting is a mechanism that can be used to "police" incoming traffic. The mechanism assign each traffic flow a bandwidth limit. All incoming traffic within a flow in excess of the bandwidth is dropped.This policy can be applied to both ingress and egress packets.

Examples

Creates a policy-map called test-policy.

Perle(config)# policy-map test-policy
Perle(config-pmap)#

queue-type |	Configure the type of queuing to use for this traffic class. ● fq-code1 ● fair-queue ● drop-tail ● priority ● random-detect Default is fair-queue

| **set-dscp** *<0-63>*} | Rewrites the DSCP field in packets in this traffic class to the specified value. |

Values are 0–63

Binary value	Configured value	Drop rate	Description
101110	46	-	Expedited forwarding (EF)
000000	0	-	Best effort traffic, default
001010	10	Low	Assured Forwarding(AF) 11
001100	12	Medium	Assured Forwarding(AF) 12
001110	14	High	Assured Forwarding(AF) 13
010010	18	Low	Assured Forwarding(AF) 21
010100	20	Medium	Assured Forwarding(AF) 22
010110	22	High	Assured Forwarding(AF) 23
011010	26	Low	Assured Forwarding(AF) 31
011100	28	Medium	Assured Forwarding(AF) 32
011110	30	High	Assured Forwarding(AF) 33
100010	34	Low	Assured Forwarding(AF) 41
100100	36	Medium	Assured Forwarding(AF) 42
100110	38	High	Assured Forwarding(AF) 43

Default is none

| **Command Modes** | Perle(config-pmap)# |

Usage Guidelines

Use this command to specify the Quality of Service (QoS) settings applied to the default class. You configure your default traffic in the same way you do with a class. Default is considered a class as it behaves like that. It contains any traffic that did not match any of the defined classes, so it is like an open class, a class without matching filters.

Examples

Set the queue type for this traffic class to random-detect.

Perle(config-pmap)#class 10
Perle(config-pmap-c)#queue-type random-detect

| {**bandwidth** *<1-2000000>* | | Changes configured bandwidth limit. |

burst *<1-20000>* |	Configure a burst size in kbytes. Default is 15Kbps
description *<LINE>* |	Configure a Policy-Map Rate-Control description.
latency *<1-5000>*}	Configure the limit on queue size. This is the maximum amount of time a packet can sit in the Token Bucket Filter. Packets with more latency then this value will be dropped since they are no longer considered useful. Value is 1 to 500 milliseconds Default is 50 milliseconds

Command Modes	Perle(config-pmapRC)#

Usage Guidelines

Use this command to configure parameters for Rate-control policy. This policy is egress only.

Rate Control is a classless policy that limits the packet flow to a set rate. It provides queuing on the Token Bucket filter algorithm. This algorithm only passes packets arriving at a rate which does not exceed an administratively set rate. Traffic is filtered based on the expenditure of these tokens.

Tokens roughly correspond to bytes. Short bursts can be allowed to exceed the limit. Once created, the rate control traffic is stocked with tokens which correspond to the amount of traffic that can be burst in one go. Tokens arrive at a steady rate, until the bucket is full—newly arriving tokens are discarded. To send a packet, the regulator must remove from the bucket a number of tokens equal in representation to the packet size.

Examples

Set the latency for this rate-control policy to 100 milliseconds.

Perle(config)#policy-map rate-control factory-RC bandwidth 2000
Perle(config-pmapRC)#latency 100

(config-pmapPQ)

{**class** *<1-7>* \| **default** \|

description *<LINE>*}

Use the no form of this command to negate a command or set to defaults.

Syntax Description	**(config-pmapPQ)**
{**class** *<1-7>* | **default** |	Configure a priority queue class identifier.

description *<LINE>*}	Configure the description of this Priority Queue policy-map.

Command Modes	Perle(config-pmapPQ)#

Usage Guidelines

Use this command to create a Priority-Queue Policy map. This policy is egress only.

Your router has four types of outbound traffic queues based on priority: low, normal, medium, and high. These outbound traffic queues are divided into seven priority queues (see table below). The queue priority determines the order of exit for packets in the queue. For example, the packets in a high priority (6–7) queue leave the router before packets in other queues. If packets continually fill the higher priority queues, those waiting in lower priority queues will not be serviced until the higher priority traffics load finishes.

Priority Assigned to Packet	Port Queue	Priority	Order of Exit
6-7	6-7	High	1
4-5	4-5	Medium	2
0, 3	0, 3	Normal	3
1-2	1-2	Low	4

Examples

This example creates a priority queue called important with a class identifier of 7.

Perle(config)#policy-map priority-queue priority
Perle(config-pmapPQ)#class 7trricky sok

Use the no form of this command to negate a command or set to defaults.

Syntax Description	**(config-remote-mgmt)**
{**restful-api cookie-max-age** |	Enables set-cookie based authentication. Values are 1 to 20160 (14 days) Default is 1440 minutes (24 hours)

http local-port |	If enabled, the router accepts and responds to HTTP Restful client requests.
	Values for local port are 80, 1025 to 65535 Default local port is 8080 Default is Disabled
https local-port |	If enabled, the router accepts and responds to HTTPS Restful client requests.
	Values for the local port are 443, 1025 to 65535 Default is Disabled
jwt [claims aud *<WORD>* | **exp** *<1-3153600>* | **iat** *<WORD>* | **iss** *<WORD>* | **jti** *<WORD>* | **nbf** *<1-31336000>* | **sub** *<WORD>*] | **jws algorithm** **es256** | **es384** | **es512** | **hs256** | **hs384** | **hs512** | **ps256** | **ps 384** | **ps512** | **rs256** | **rs384** | **rs512** | **none] | key import terminal**}	**Claim sets:** **aud: audience**—identifies the recipients that the JWT is intended for. This tends to be the "client id" or "client key" of the application that the JWT is intended to be used by. It allows the client to verify that the JWT was sent by someone who actually knows who they are.
	exp: expiration time—identifies the expiration time on and after which the JWT must not be accepted for processing Values are 1–3153600 seconds Default is 3153600 seconds

iat: issued at—identifies the time on which the JWT will start to be accepted for processing

iss: issuer—identifies principal that issued the JWT

jti: JWT ID—case sensitive unique identifier of the token

nbf: not before—JWT will start to be accepted for processing at this time

Values are 1–3156000 seconds

sub: subject—identifies the subject of the JWT

Algorithm types:

- es256
- es384
- es512
- hs256
- hs384
- hs512
- ps256
- ps384
- ps512
- none

key—import the key via the terminal screen. To end entry type "quit" on a blank line by itself.

Command Modes	Perle(config-remote-mgmt)#

Usage Guidelines

Use this command to configure RESTful API options.

JSON Web Token (JWS) is an Internet standard way to securely transfer information between devices as a JSON object. This information can be verified and trusted because it is digitally signed. JSON Web Tokens (JWTs) can be signed using an algorithm or a public/private key pair.

Examples

This example sets the local port for HTTPS to 1025.

Perle(config-remote-mgmt)#restful-api https local-port 1025

route-map

route-map

{*<WORD> <1-65535>* **[deny** *<1-65535>* **| permit** *<1-65535>***]**}

Use the no form of this command to negate a command or set to defaults.

Syntax Description	**route-map**

{*<WORD> <1-65535>* **[deny** *<1-65535>* **| permit** *<1-65535>***]**}	Insert, delete, deny, or permit from existing route map table.

Command Modes	Perle(config)#route-map

Usage Guidelines

Use this command to create route maps or enter route map command mode.

Examples

This example creates a route map called test-route.

Perle(config)#route-map test-route

Specify the ASN number or the IP address of the aggregator. **as-path—excludes**—removes the AS path from a BGP AS-path attribute (up to 10 numbers) **as-path—prepend**—prepends to the AS path of the route (up to 10 numbers) **atomic-aggregate**—sets the atomic aggregate attribute in a route **comm-list**—set the BGP community list for deletion **community**— community number—configure the community number or AA:NN

internet—internet (well know community)

local-AS—do not send outside local AS

no-advertise—do not advertise to any peer

no-export—do not export to next AS

ip—modifies the next hop destination of a route

ipv6—modifies the IPv6 next-hop destination of a route.

ocal-preference—modifies the BGP local-pref attribute in a route

metric—modifies the metric of a route

metric-type—specifies the OSPF external metric-type for a route

origin—modifies the BGP origin code of a route

originator-id—modifies the BGP originator ID attribute of a route

src—modifies th BGP source address for the route

tag—modifies the OSPF tag value of a route

weight—modifies the BGP weight of a route

Command Modes	Perle(config-route-map)#

Usage Guidelines

Use this command to configure route map parameters.

Examples

This rule defines a match rule for community list BGP 50.

Perle(config-route-map)#match community 50

Related Commands

show route-map

router

router

{**bgp** *<1-4294967295>* |

ospf |

rip}

Use the no form of this command to negate a command or set to defaults.

Syntax Description	**router**

{**bgp** *<1-4294967295>* |	Configures Broader Gateway Protocol (BGP) routing protocol on the router. If using your router to connect to the Internet, BGP should be enabled.
	Configure the autonomous system number (ASN) is a unique number that's available globally to identify an autonomous system and which enables that system to exchange exterior routing information with other neighboring autonomous systems.
	Your service provider will assign you the first three digit for ASN, the last two digits should be unique.
	Values are 1–4294967295
ospf |	Configure OSPF routing protocol on the router.
	Open Shortest Path First (ospf) is a protocol used to find the best paths for packets as they pass through a set of connected networks. OSFP was designed to replace the RIP protocol as it optimizes the updating up of the routing table. OSPF should be enabled on your router.
rip}	Configure RIP routing protocol on the router.
	Routing Information Protocol (rip). Older protocol for finding the shortest path for routing information using a routing metric/hop count algorithm. RIP should be enabled on your router if there are older routers on your network that need to use RIP.
Command Modes	Perle(config)#router

Usage Guidelines

Use this command to select the routing protocol for your router.

Examples

This example sets the routing protocol to BGP.

Perle(config)#router bgp 10

Syntax Description	**(config-router)-BGP** **Some parameters may not be available on some firmware versions or models.**
{bgp address-family ipv4 | ipv6 unicast |	Enters address family mode.
aggregate address <*A.B.C.D*> <*A.B.C.D*> as-set | summary-only |	Specifies the block of addresses to be aggregated. **as-set**—specifies that the routes resulting from the aggregation include the AS-set. **summary-only**—specifies that aggregated routes are summarized. These routes will not be advertised.

bgp always-compare-med | [bestpath as-path confed | ignore] | [compare-router-id] | [med confed | missing-as-worst] | [client-to-client reflection] | [cluster-id *<1-4294967295> <A.B.C.D>*] | [confederation identifier *<1-4294967295>* | peers *<1-4294967295> <1-4294967295>*] | [dampening *<1-45> | <1-20000> | <1-20000> | <1-255>*] | [deterministic-med] | [enforce-first-as] | [fast-external-failover] | [graceful-restart stalepath-time *<1-3600>*] | [log-neighbor-changes | network import-check | [router-id *<A.B.C.D>*] |

Configure BGP parameters.

always-compare—directs the router to compare the MED for paths from neighbors in different autonomous systems.
Default is disabled

best-path
as-path [confed | ignore]—directs the router to compare the AS paths during best-path selection
Default is does not compare

compare-router-id—directs the router to compare identical routes received from different external peers during best path selection
Default is does not compare

med confed | missing-as-worst—direct the router to compare the Multi Exit Discriminator (MED) among paths learned from confederation peers during best path selection

client-to-client reflection—enables or disables route reflection from a BGP route reflector to clients.
Default is disabled

cluster-id—sets the cluster ID for a BGP route reflection cluster as a 32 bit number
Values are 1–4294967295 or IP address
Default is none

confederation identifier | peers—Defines a BGP confederation.
Values are AS number 1–4294967295
Peers range from 1–4294967295 to 1–4294967295
Values are 128 peers

dampening—enables or disables route dampening and sets router dampening value.
half-life—1 to 45 mins
Default is 15 mins

reusing-route—1 to 20000
Default is 750

start-suppress-time—to 20000
Default is 20000

max-suppress-time—1 to 255
Default is 4 x of half life

deterministic-med—enables of disables enforcing of deterministic MED

enforce first-as—forces eBGP peers to list AS number at the beginning of the AS_path attribute in coming updates
Default is disabled

fast-external-failover—immediately reset session if a link to a directly connected external peer goes down
Default is disabled

graceful-restart—enables or disables grateful restart of the BGP process

Default is enabled
Grateful stale-time is 1-3600 seconds
Graceful stale time default is 360 seconds

log-neighbor-changes—log neighbor up/ down and reset reason
Default is disable

network import-check—check BGP network route exists in IGP
Default is enabled

router-id—configure a fixed BGP router ID for the router, overriding the automate ID selection process
Default automatically selected by BGP

distance *<1-255> <A.B.C.D>* *<A.B.C.D/nn>* | **bgp distance** *<1-255> <1-255> <1-255>* |	Enter an **Administrative Distance**.
	(AD) is a value that your router uses to select the best path when there are two or more different routes to the same destination from two different routing protocols. Administrative distance is the reliability of a routing protocol. A static route is normally set too 1. The smaller the administrative distance value, the more reliable the protocol. Administrative Distance is locally significant, it is not advertised to the network. Range is 1-255 (with 1 being the most reliable) and 255 is route not used or unknown
	Configure a source IP prefix address and mask.
	BGP distance Distance for external router to AS Values are 1 to 255 Default 20
	Distance for internal outer to AS Values 1 to 255 Default is 200
	Distance for local router Value 1 to 255 Default 200
maximum-paths *<1-64>* **ibgp** *<1-64>* |	Configure the maximum number of eBGP/iBGP paths to a destination.
	ebgp values are 1 to 255 Default is 1
	ibgp values are 1 to 255 Default is 1

neighbour *<A.B.C.D>* *<X:X:X:X::X>* **[advertisement-interval** *<0-600>*] | **[allowas-in** *<1-10>*] | **asoverride** | **[attribute-unchanged as-path | med | next-hop]** | **[capability dynamic | orf prefix-list both | receive | send]** | **[default originate route-map** *<NAME>*] | **[description** *<LINE>*] | **[disable-connected-check]** | **[distributed-list** *<1-99>* **in | out** *<1300-2699>* **in | out]** | **[dont't-capability-negotiate]** | **[ebgp-multihop** *<1-255>*] | **[filter-list** *<WORD>*] | **[local-as** *<1-4294967295>* **no-prepend]** | **[maximum-prefix** *<1-4294967295>*] | **[next-hop-self]** | **[override-capability]** | **[passive]** | **[password** *<LINE>*] | **[port** *<1-65535>*] | **[prefix-list** *<WORD>* **in | out]** | **[remote-as** *<1-4294967295>*] | **[remove-private-as]** | **[route-map** *<WORD>* **in | out]** | **[route-reflector -client]** | **[route-server-client]** | **[send-community both | extended | standard]** | **[shutdown]** | **[soft-reconfiguration]** | **[strict-capability-match]** | **timers** *<0-65535>* *<0-65535>* | **connect** *<0-65535>*] | **[ttl-security hops** *<1-254>* | **[unsuppress-map** *<WORD>* | **update-source interface bvi** *<1-9999>* | **cellular** *<0-0>* | **dialer** *<0-15>* | **dot11radio** *<0-4>* | **ethernet** *<1-5>*. *<1-4000>* | **openvpn-tunnel** *<0-999>* | **tunnel** *<0-999>* | *<X:X:X:X::X>*] | **[weight** *<1-65335>*] |

Configure neighbor configuration.

neighbor address—specify an IPv4 or IPv6 address.

advertisement-interval—configure the minimum interval between sending BGP routing updates.

Values 0 to 600
Default eBGP is 30 secs
Default iBGP peers is 5 seconds

allowas-in—allows or disallows receiving BGP advertisements containing the AS path of the local router.
Default readvertisement is disabled.
Default is 3

as-override—override ASN's in outbound updates if AS–path equals remote–AS.
Only applies to eBGP neighbor.
Default is disable

attribute-unchange—allows the router to send updates to a neighbor with unchanged attributes.
Value is on for all if no option provided
Default is disabled

capability—advertise dynamic capability to this neighbor.

Default is session is brought up with minimal capability on both sides

capability orf prefix-list [both | receive | send]—advertises support for Outbound Route Filtering (OFR) for updating BGP capabilities advertised and received from this neighbor.
Default is the session is brought up with minimal capability on both sides.

default-originate—enables or disables forwarding of the default route to a BGP neighbor.

Default is disabled

Description—provide a description for a BGP neighbor.

disable-connected-check—Enables a directly connected eBGP neighbor to peer using a loopback address without adjusting the default TTL of 1.

Default is off

distributed-list—applies an access list to filter inbound/outbound routing updates from this neighbor.
Default is none

dont' capability-negotiate—disables BGP capability negotiation
Default is capability negotiation is performed.

ebgp-mulihop—Allows you to establish eBGP peer relationships between routers that aren't directly connected to one another.
Default is only directly connected neighbors are allowed

filter-list—applies an AS–path list to routing updates to this neighbor
Default is none

local-as—defines a local autonomous system number for eBGP peering
Default is none

maximum-prefixes—configure the maximum number of prefixes to accept from this neighbor before that neighbor is taken down.
Values are 1–4294967295
Default is none

next-hop-self—sets the local router as the next ho for this neighbor
Default is disable

over-ride-capability—overrides capability negotiation to allow a peering session to be established with a neighbor that does not support capabilities negotiation
Default is a session cant be established if the neighbor does not support capability negotiation

passive—directs the router not to initiate connections with this neighbor

password—Configure a BGP MD5 password
Default is none

port—specifies the port on which the neighbor is listening for BGP signals
Values are 1 to 65535
Default port is 179

prefix-list- applies this prefix list filter updates to/from this neighbor
Default is none

remote-as—Configure the autonomous system number of the neighbor.
Default is none

remove-private-as—directs the router to remove private AS numbers from updates sent to this neighbor (eBGP only)
Default is disable (do not remove)

route-map—applies a route map to filter updates to/from this neighbor
Default is none

route-reflector—specify this neighbor as a route reflector client (iBGP only)
Default is disabled

route-server-client—specify this neighbor as a route server client
Default is disable

send-community—enables or disables the sending of community attributes to the specified neighbor

Value— no type specified send standard attributes
Default is both

shutdown—administratively shuts down a BGP neighbor
Default is disabled

soft-reconfiguration—directs the router to store received routing updates

strict-capability-match—directs the router to strictly match the capabilities of the neighbor
Default is disable

timers—
keepalive interval
Values are 0–-65535
Default is 60 seconds

holdtime

Value are 0-65535
Default is 180 seconds

connect
Values are 0-65535
Default is 120 seconds

	ttl-security—Configure the time-to-live (ttl) security hop count. This option and ebgp-multihop cannot be set at the same time Values are 1 to 254 hops Default is 1
	unsupress-map—directs the router to selectively advertise routes suppressed by aggregating addresses, based on a route map Value specify a router map Default is none
	update-source—specifies the source ip address or interface for routing updates Default is none
	weight—defines a default weight for routes from this neighbor Values are 1-65335 Default is routes learned from a BGP neighbor have a weight of 0. Routes sourced by the local router have a weight of 32768
network *<A.B.C.D>* *<A.B.C.D>* | **backdoor** | **route-map** *<WORD>* |	Configure a network to be advertised by the BGP routing process. **Backdoor**—indicates that this network is reachable by a back door route. A back door network is considered to be like a local network but is not advertised. **Route-map**—specifies a configured route map to be used when advertising the network Default is none
redistribute connected | **kernel** | **ospf** | **rip** | **static** | **metric** *<1-4294967295>* | **route-map** *<WORD>* |	Select route type for redistribution. BGP. Connected (directly attached subnet or host) • Kernel • OSPF • RIPng • Static Select a router map from the drop-down list.

	Configure the metric used by the routing protocol to calculate the best path to a given destination.
	Value range is 1-4294967295
	A route map consists of a series of statements to check if the route matches the policy, then it permits or denies the route.
	Default is none
timers bgp *<0-65535> <0-65335>*}	Configure BGP times globally for the local router. Keepalive interval Values are 0-65535 Default is 60 seconds Hold-time Values are 0-65535 Default is 180 seconds
Command Modes	Perle(config-router)#

Usage Guidelines

Use this command to configure BGP protocol parameters.

Examples

This example sets BGP timers keepalive to 10 seconds and hold time to 20 seconds.
Perle(config-router)#timers bgp 10 20

Related Commands

timers basic *<5-2147483> <5-2147483> <5-2147483>*}

Use the no form of this command to negate a command or set to defaults.

Syntax Description	(config-rtr)
{**rip default-information originate** |	Controls distribution of default information
default-metric *<1-16>* |	Configure the metric for redistributed routes.
distance *<1-255>* |	Enter an **Administrative Distance**. (AD) is a value that your router uses to select the best path when there are two or more different routes to the same destination from two different routing protocols. Administrative distance is the reliability of a routing protocol. A static route is normally set too 1. The smaller the administrative distance value, the more reliable the protocol. Administrative Distance is locally significant, it is not advertised to the network. Range is 1-255 (with 1 being the most reliable) and 255 is route not used or unknown
distribution-list [*<WORD>* | **prefix** *<WORD>*] | [**in** | **out**] [**bvi** *<1-9999>*] | [**cellular** *<0-0>*] | [**dialer** *<0-15>*] | [**dot11radio** *<0-4>*] | [**ethernet** *<1-5>. <1-4000>*] | [**openvpn-tunnel** *<0-999>*] | [**tunnel** *<0-999>*] |	Filters networks in routing updates. Select the access list for IPv6 name or filter prefixes in routing updates. Specific whether the filter is for inbound or outbound. Specify the interface to apply this distribution list to.
network *<A.B.C.D>* *<A.B.C.D>* |	Enables routing on a network.
passive-interface bvi *<1-9999>* | **cellular** *<0-0>* |**dialer** *<0-15>* | **dot11radio** *<0-4>* | **ethernet** *<1-5>. <1-4000>*| **openvpn-tunnel** *<0-999>* | **tunnel** *<0-999>* | **all** |	Suppress routing updates on an interface.
redistribute connected | **kernel** | **ospf** | **rip** | **static** | **metric** *<1-4294967295>* | **route-map** *<WORD>* |	Redistribute information from other routing protocol.
route *<X:X:X:X::X>/<0-128>* |	Static route setup.

timers basic *<0-65535> <0-65535> <0-65535>*}	Timers basic—
	Update period 0-65535
	Route timeout period 0-65535
	Route hold down period in seconds 0-65535

Command Modes	Perle(config-rtr)#

Usage Guidelines

Use this command to configure RIP protocol parameters.

Examples

This example sets timer for RIP updates to every 5 seconds.

Perle(config-router)#timers basic 5

Area—OSPF area ID in decimal format or IP address format

Authentication—enables message-digest authentication

Default-cost—Configure a default metric to be applied to routes being distributed into OSPF.
Range is 0 to 16777214
Default is none

NSSA
- No summary—Configure the OSFP VRF instance to not inject the inter-area routes into NSSA.
- Candidate translate—Configure the NSSA-ABR always to translate election.
  Default is enabled
- Always translate—Configure the NSSA-ABR never to translate.
  Default is enabled
- Never translate—Configure the NSSA-ABR server never to translate.
  By default this is disabled

Range—Configure a prefix specified as IP address and subnet mask.
- **Advertise**—sets the address range status to advertise and generates a Type 3 summary LSA.
- **Not-advertise**—sets the address range status to Do Not Advertise. The Type 3 summary LSA is suppressed and the component networks remain hidden from other networks.
- **Substitute—**(network prefix to be announced instead of range).
  The default is advertise
- **Cost**—Configure the metric for this area range.
  Range is 0 to 16777215 |

Shortcut—This parameter allows to "shortcut" routes (non-backbone) for inter-area routes.

- enable—use this area for shortcutting
- disable—never use this are for route shortcutting
- default—use this area for shortcutting—only if the ABR does not have a link to the backbone area or this link was lost

stub no-summary—no-summary option creates a totally stubby area. A totally stubby area keeps only the intra-area routes (the O routes), and for any inter-area routing, it has a default route

Virtual Link IP Address—IPv4 address of this virtual link.

Authentication—Configure a password used by neighboring routers for simple password authentication. It can be any continuous string of up to eight characters. There is no default value.

- None—no password
- Authentication-key—Configure an authentication key for simple password authentication.
- Message-digest—(Optional) Identifies the key ID and key (password) used between this router and neighboring routers for MD5 authentication.

Shortcut—This parameter allows to "shortcut" routes (non-backbone) for inter-area routes.

- enable—use this area for shortcutting
- disable—never use this are for route shortcutting.
- default—use this area for shortcutting—only if the ABR does not have a link to the backbone area or this link was lost

stub no-summary—no-summary option creates a totally stubby area. A totally stubby area keeps only the intra-area routes (the O routes), and for any inter-area routing, it has a default route

Virtual Link IP Address—IPv4 address of this virtual link.

Authentication—Configure a password used by neighboring routers for simple password authentication. It can be any continuous string of up to eight characters. There is no default value.

- None—no password
- Authentication-key—Configure an authentication key for simple password authentication.
- Message-digest—(Optional) Identifies the key ID and key (password) used between this router and neighboring routers for MD5 authentication.

The default is none.

Dead-interval—Configure the interval during which at least one hello packet must be received from a neighbor before the router declares that neighbor as down (dead).) As with the hello interval, this value must be the same for all routers attached to a common network.

Default is 4 times the hello interval
Default is 40 seconds

Hello interval—Configure the hello packet time interval for hello packets sent on an interface.
The default is 10 seconds.

Retransmit interval—Configure the time between link-state advertisement (LSA) retransmissions for adjacencies that belong to the virtual link.
Default is 5

Transmit delay—Before a link-state update packet is propagated out of an interface, the routing device increases the age of the packet. The transit delay sets the estimated time required to transmit a link-state update on the interface. By default, the transit delay is 1 second.You should never have to modify the transit delay time. To avoid LSAs from aging out during transmission, set an LSA retransmission delay especially for low speed links.
Default is 5 seconds.

auto-cost reference-bandwidth *<1-4294967>* |	Directs the router to use reference bandwidth method for calculating administrative costs.
	Default reference bandwidth is 108 Mbps.
capability opaque |	Enables support for opaque link-state advertisement as described in RFC2370.
	Default is disabled
compatibility rfc1583 |	Indicates whether handing of AS external routes should comply with RFC 1583.
	Default is disabled.
default-information originate always | metric *<0-16777214>* | **metric-type** *<1-2>* | **route-map** *<WORD>* |	Sets the characteristics of an external default route originated into an OSPF routing domain.
	Default is off
default-metric *<0-16777214>* |	Configure a default metric to be applied to routes being distributed into OSPF. Range is 0–16777214
	Default is none
default-metric *<0-16777214>* |	Configure a default metric to be applied to routes being distributed into OSPF. Range is 0–16777214
	Default is none
distance *<1-255>* | **[ospf external** *<1-255>***]** | **[inter-area** *<1-255>***]** | **[intra-area** *<1-255>***]** |	Enter an **Administrative Distance**. (AD) is a value that your router uses to select the best path when there are two or more different routes to the same destination from two different routing protocols. Administrative distance is the reliability of a routing protocol. A static route is normally set too 1. The smaller the administrative distance value, the more reliable the protocol. Administrative Distance is locally significant, it is not advertised to the network. Range is 1-255 (with 1 being the most reliable) and 255 is route not used or unknown Value is 1-255 Default is 110

	OSPF External—Sets the OSPF for routes injected by redistribution. Range is 1–255 Default is 110
	OSFP inter-area routes—Sets the OSPF administrative distance by route type. Routes from another area are inter-area. Range is 1–255 Default is 110
	OSFP intra-area routes—Sets the OSPF administrative distance by route type. Routes within an area are intra-area. Range is 1–255 Default is 110
max-metric router-lsa administrative | on-shutdown *<5-86400>* **| on-startup** *<5-86400>* |	Enables or disables the OSFP maximum / infinite-distance metric. **Administratively**—administratively applied for an indefinite period **on shutdown**—advertise stub-router prior to full shutdown of OSPF **on-startup**—advertise a maximum metric at startup. on shutdown/on-startup value is 5–86400 seconds Range is 5 to 86400 seconds Default is 600 seconds
neighbor poll-interval *<1-65535>* **| priority** *<0-255>* |	Configure the dead-router polling interval for non-broadcast neighbor. Values are 1-65535 in seconds Default is 120 in seconds Priority of non-broadcast neighbor. Values are 0-255 Default is 1
max-metric router-lsa administrative | on-shutdown *<5-86400>* **| on-startup** *<5-86400>* |	Configure a default metric to be applied to routes being distributed into OSPF. Range is 0–16777214 Default is none

neighbor poll-interval *<1-65535>* | **priority** *<0-255>* |	Enter an **Administrative Distance**.
	(AD) is a value that your router uses to select the best path when there are two or more different routes to the same destination from two different routing protocols. 	Range is 1-255 (with 1 being the most reliable) and
	255 is route not used or unknown
	Value is 1-255
	Default is 110
	OSPF External—Sets the OSPF for routes injected by redistribution. Range is 1–255 Default is 110
	OSFP inter-area routes—Sets the OSPF administrative distance by route type. Routes from another area are inter-area. Range is 1–255 Default is 110
	OSFP intra-area routes—Sets the OSPF administrative distance by route type. Routes within an area are intra-area. Range is 1–255 Default is 110
network *<A.B.C.D>* *<A.B.C.D>* **area** *<0-4294967295>* *<A.B.C.D>* |	Configure IPv4 network address. Configure IPv4 wildcard address. Configure the area id or ip address.
passive-interface bvi *<1-9999>* | **cellular** *<0-0>* | **dialer** *<0-15>* | **dot11radio** *<0-4>* | **ethernet** *<1-14>. <1-4000>* | **tunnel** *<0-999>* | **all** |	Suppresses routing updates on an interface or all interfaces.
redistribute connected | **kernel** | **ospf** | **rip** | **static** | **metric** *<1-4294967295>* | **route-map** *<WORD>* |	Redistributes information from other routing protocols. Select the type of route: ● BGP ● Connected (directly attached subnet or host)

	• Kernel
	• OSPF
	• Static
	Select the route map.
refresh timer *<5-1800>* |	The router automatically updates link-state information with its neighbors. Only an obsolete information is updated when age has exceeded a specific threshold. Range is 10–1800 seconds Default is 1800 seconds
router-id *<A.B.C.D>* |	Configure a global OSPF router ID. If this command is not configured, OSFP chooses an IPv4 address as the router ID from one of its interfaces. If this command is used on an OSPF instance that has neighbors, OSFP uses the new router ID at the next reload or restart of OSFP.Router-ID for this OSPF process.
timers throttle spf *<1-600000> <1-600000> <1-600000>*}	Delay between receiving a change to SPF calculation in milliseconds. Range is 1–600000 milliseconds Default is 1 milliseconds
	Delay between first and second SPF calculation. Range is 1–600000 milliseconds Default is 1 milliseconds
	Maximum wait time in milliseconds for SFP calculations. Range is 1–600000 milliseconds Default is 1 milliseconds
Command Modes	Perle(config-router)#

Usage Guidelines

Use this command to configure OSPF protocol parameters.

Examples

This example sets opaque feature for OSPF.
Perle(config-router)#capability opaque

sdm

sdm

{**prefer default \| dual-ipv4-and-ipv6 default**}

Use the no form of this command to negate a command or set to defaults.

Syntax Description	**sdm**

{**prefer default** | **dual-ipv4- and-ipv6 default**}	The sdm command is used to set IP protocols on your router.
Command Default	sdm prefer default (IPv4)
	(both IPV4 and IPV6 enabled)
Command Modes	Perle(config)#sdm

Usage Guidelines

By default the Router is set for IPv4. To enable both IPv4 and IPv6 see the example below.

Examples

This example sets your router for both IPv4 and IPv6 traffic.

Perle(config)# sdm prefer dual-ipv4-and-ipv6 default

Use the no form of this command to negate a command or set to defaults.

Syntax Description	**(config-user-serial)**
{**callback off** | **on** |	Set the port for callback mode. ● on ● off
framed-compression off | **on** |	Configure Van Jacobson Compression. ● on ● off
framed-interface-id *<ipv6 interface id>* |	Configure the IPv6 interface identifier. The second part of an IPv6 unicast or anycast address is typically a 64-bit interface identifier used to identify a host's network interface. For example, if the MAC address of a network card is 00:BB:CC:DD:11:22 the interface ID would be 02BBCCFFFEDD1122
framed-ip *<A.B.C.D>* |	Configure the IPv4 address
framed-mtu *<64-1500>* |	Configure Maximum Transmission Unit (mtu) size. Default is 1500 Values are 64 to 1500
host-ip *<Hostname>* | *<A.B.C.D>* | *<X:X:X:X::X>* |	Configure a hostname, IPv4 or IPv6 address.
hotkey-prefix *<1-ff>* |	The prefix that a user types to control the current session. ● Data Options: ^a number—To switch from one session to another, press ^a (Ctrl-a) and then the required session number. For example, ^2 would switch you to session 2. Pressing ^a 0 returns you to the Router Menu.

	^a n—Display the next session. The current session remains active. The lowest numbered active session is displayed. ^a p—Display the previous session. The current session remains active. The highest numbered active session is displayed. ^a m—To exit a session and return to the router. You are returned to the menu. The session is left running. ^a l—(Lowercase L) Locks the serial port until the user unlocks it. The user is prompted for a password (any password, excluding spaces) and the serial port is locked. The user must retype the password to unlock the serial port. ^r—When you switch from a session back to the Menu, the screen may not be redrawn correctly. If this happens, use this command to redraw it properly. This is always Ctrl R, regardless of the Hotkey Prefix. The User Hotkey Prefix value overrides the Serial Port Hotkey Prefix value. You can use the Hotkey Prefix keys to lock a serial port only when the serial port's Allow Port locking parameter is enabled. Default is Hex 01 (Ctrl -a or ^a)
idle-timer *<0-4294967>* |	Configure a session inactivity timer in seconds. Default is 0 seconds so the port never times out. Values are 0 to 4294967 seconds
line-access readin *<1-8> <17-24>* | **readout** *<1-8> <17-24>* | **readwrite** *<1-8> <17-24>* |	Configure the access for the serial lines.
netmask *<A.B.C.D>* |	Configure the IPv4 netmask
phone-number *<phone-number> <A.B.C.D>* |	Configure the call back phone number.

port ssh *<1-65535>*| **ssl_raw** *<1-65535>* | **tcp-clear** *<1-65535>* | **telnet** *<1-65535>* |	Configure the service to be used for outbound sessions on this port. ● ssh ● ssl-raw ● tcp-clear ● telnet
routing listen | **none** | **send** | **send-and-listen** |	Configure the routing mode (RIP, Routing Information Protocol) used on the PPP/SLIP interface. ● listen—enable PPP/SLIP receiving of RIP ● none—disable PPP/SLIP sending and receiving of RIP ● send—enable PPP/SLIP sending and receiving of RIP ● send-and-listen—enable PP/SLIP sending and receiving of RIP
service dsprompt | **ppp** | **rlogin** | **slip** | **ssh** | **ssl-raw** | **tcp-clear** | **telnet** |	Configure the service for outbound sessions. ● dsprompt ● ppp ● rlogin ● slip ● ssh ● ssl-raw ● tcp-clear ● telnet
sess-timer *<0-4294967>* |	Configure the maximum session time. Default is 0 seconds so the port never times out. Values are 0 to 4294967 seconds
session *<1-4>* **[auto off** | **on]** | **[rlogin-options host** *<hostname>* | *<A.B.C.D>* | *<X:X:X:X::X>*| **termtype** *<WORD>*] | **ssh-options** | **telnet-options echo** *<0-0x7f>* | **eof** *<0-0x7f>* | **erase** *<0-0x7f>* | **escape** *<0-0x7f>* | **host** *<hostname>* | *<A.B.C.D>* | *<X:X:X:X::X>* | **intr** *<0-0x7f>* | **[line-mode off** | **on]** |	Configure user session parameters.

wan

wan

{**failover** |

high-availability disable | failover | load-sharing] |

load-sharing flush-connections | local traffic | rule *<1-9999>* **| source-nat | sticky-inbound**}

Use the no form of this command to negate a command or set to defaults.

Syntax Description	wan
{**failover** |	Configure failover. Failover is defined as a mode where 2 or more WAN interfaces are configured, but only 1 interface is active at a time. Once IP HEALTH has detected that a WAN interface no longer has Internet connectivity, it will "failover" to the next active (via IP HEALTH status) WAN interface. **Note:** IP HEALTH profile(s) (ie. Ping or traceroute tests) and IP-HEALTH on EACH of the WAN interfaces, must be configured when using Wan high-availability. The IP HEALTH feature is used to determine whether an WAN interface has Internet connectivity (one or more of the ping or traceroute tests MUST pass).
high-availability disable | failover | loadsharing |	Configure the action for the High-availability feature.
load-sharing}	Configure Load Sharing. Load Sharing defines how routed traffic is sent over one or more configured active WAN interfaces. Unlike Failover mode where ALL routed traffic is cut over to the next highest priority active WAN interface, this mode defines how specific or all traffic is to be shared or divided over multiple active WAN interfaces. This is accomplished by defining one or more Load Sharing rules. **Flush-connections**—enables flushing to flush data on WAN interface outage. **Local traffic**—enables all local traffic in the rule. **Rule**—Configure a load–sharing rule.

| | **Source-nat**—enables/disables source address translation on this rule. |
| | **Sticky-inbound**—enables/disables inbound connection tracking. |

Command Modes	Perle(config)#wan

Usage Guidelines

Use this command to configure High Availability, Failover and Load Sharing features.

Examples

This example sets disables the High Availability feature.

Perle(config)#wan high-availability disable

Command	Perle(config-load-sharing-rules)#

Usage Guidelines

Use this command to configure load sharing rules.

Examples

This example configures the BVI interface 10 to be part of WAN load sharing.
Perle(config-loadshare-rule)#wan bvi 10

Related Commands
show ip route
show wan

(config-import-disk)

zone

zone
{security *<WORD>***}**

Use the no form of this command to negate a command or set to defaults.

Syntax Description	**zone**
{**security** *<WORD>*}	Name of security zone.
Command Modes	Perle(config)#zone

Usage Guidelines

Use this command to create a security zone.

Examples

This example creates a zone with the name secure1.

Perle(config)#zone security secure1

Related Commands

zone-pair
show zone-policy

(config-sec-zone)

{**default-action drop | reject** | **description** *<WORD>* | **local-zone**}

Use the no form of this command to negate a command or set to defaults.

Syntax Description	**(config-sec-zone)**
{**default-action drop	reject**		Configure the default action for traffic coming into this zone. • Drop packets—silently drop the packets • Reject—drops packets and notifies the source Enter a zone description. Zone to be local-zoned.
description *<WORD>*		Configure security zone description.
local-zone}	Sets zone to be local.
Command Modes	Perle(config-sec-zone)#

Usage Guidelines

Use this command to setup a default action for zone firewall.

Examples

This example rejects all incoming packets to this zone.

Perle(config)# default-action reject

Related Commands

show zone-policy (config-import-disk)

zone-pair

zone-pair

zone-pair

{**from** *<WORD>* **to** *<WORD>* **firewall** *<WORD>* | **ipv6-firewall** *<WORD>*}

Use the no form of this command to negate a command or set to defaults.

Syntax Description	zone-pair
{**from** *<WORD>* **to** *<WORD>* **firewall** *<WORD>*	**ipv6-firewall** *<WORD>*}	Configure parameters for zone pair firewalls. ● From—zone from which to filter traffic ● To—zone to which to filter traffic ● Firewall—select firewall to be used to filter traffic (IPv4 or IPv6)
Command Modes	Perle(config)#zone-pair

Usage Guidelines

Use this command to create zone-pair firewalls.

Examples

This example filters traffic from lab-zone to office-z using secure zone 1.

Perle(config)#zone-pair from lab-zone to office-zone firewall secure1
Note: Secure zone 1 needs to be created first.

Related Commands

show zone-policy (config-import-disk)

⑤ Interface configuration

This chapter defines all the CLI commands in Interface Configuration Mode. Some CLI commands may not be applicable to your model or running software.

Interface

interface
{**bvi** *<1-9999>* |
cellular *<0-0>* |
dialer *<0-15>* |
dot11radio *<0-4>* |
ethernet *<1-5>* . *<1-4000>* |
loopback |
openvpn-tunnel *<0-999>* | **tap** | **tun** |
tunnel *<0-999>* |
range ethernet *<1-5>*}

Use the no form of this command to negate a command or set to defaults.

Syntax Description	interface
{**bvi** *<1-9999>* |	Configure for a bridge interface. See *(config-if)#bvi*.
cellular *<0-0>* |	Configure for a cellular interface. See *(config-if)#cellular*.
dialer *<0-15>* |	Configure for a dialer interface. See *(config-if)#dialer*
dot11radio *<0-4>* |	Configure for a wireless interface. See *(config-if)#dot11radio*
ethernet *<1-5>* . *<1-4000>*|	Configure for an Ethernet interface. See *(config-if-ethernet)#*
loopback |	Configure for a loopback interface.
openvpn-tunnel *<0-999>* **tap | tun** |	Configure for an OpenVPN tunnel interface. See *(config-if)#openvpn-tunnel*
tunnel *<0-999>* |	Configure for a tunnel interface. See *(config-if)#tunnel*
range ethernet *<1-5>*}	Configure an Ethernet range. *(config-if-range)#*
Command Modes	Perle(config) #interface ethernet 1 Perle(config-if)#

Usage Guidelines
Use this command to configure the interface type and number.

Examples

This example enter sub-menu configuration for Ethernet interface 1.

Perle(config)#interface ethernet 1

Related Commands

(config-if)#bvi

(config-if)#openvpn-tunnel

(config-if)#tunnel

(config-if)#dot11radio

(config-if)#cellular

(config-if)#dialer

Syntax Description	**(config-if)#bvi**
{arp disable-arp-filter | enable-arp-accept | enable-arp-announce | enable-arp-ignore | enable-proxy-arp | timeout *<1-2147483>* **|**	Configure ARP parameters. **Disable ARP filter**—If enabled the router responds to the same ARP requests coming from multiple interfaces. **Enable ARP Accept**—Define behavior for gratuitous ARP frames who's IP is not already present in the ARP table: • 0—don't create new entries in the ARP table • 1—create new entries in the ARP table **Enable ARP Announce**—Define different restriction levels for announcing the local source IP address from IP packets in ARP requests sent on interface. • 0—(default) Use any local address, configured on any interface • 1—Try to avoid local addresses that are not in the target's subnet for this interface **Enable ARP Ignore**—Define different restriction levels for announcing the local source IP address from IP packets in ARP requests sent on interface. • 0—(default) Use any local address, configured on any interface • 1—Try to avoid local addresses that are not in the target's subnet for this interface **ARP Timeout**—If an ARP entry is not used for a specific amount of time the entry is removed from the caching table.
description *<LINE>* **|**	Configure interface description.

ip [address *<A.B.C.D>* *<A.B.C.D>* **secondary] | [ddns service dyndns login** *<WORD>* **password** *<WORD>* **| host** *<WORD>* **| host-group** *<WORD>* **| use-web skip** *<WORD>* **| url** *<WORD>***] | [dhcp client class-id** *<LINE>* **| auto | client-id ethernet** *<1-5>***| ascii** *<WORD>* **| auto | hex** *<Hex-String>* **| hostname** *<WORD>***] | [dhcp-relay] | [dns dhcp] | [firewall in | local | out** *<WORD>***] | [health-profile** *<WORD>* **nexthop [***<A.B.C.D>* **|** *<dhcp>* **vrrp** *<1-255>* **[bvi** *<1-9999>***] | [ethernet** *<1-5>***] good-prio** *<1-255>* **bad-prio** *<1-255>***] | [ospf authentication message-digest | null | authentication-key 0** *<WORD>* **| 7** *<WORD>* **|** *<WORD>***] | [cost** *<1-65535>* **| [dead-interval** *<1-65535>***] | [hello-interval** *<1-65535>***] | [message-digest-key** *<1-255>* **md5 0** *<WORD>* **| 7** *<WORD>* **|** *<WORD>***] | [mtu-ignore] | [network broadcast | non-broadcast|point-to-multipoint point-to-point] | [priority** *<0-255>***] | [retransmit-interval** *<1-65535>***] | [transmit-delay** *<1-65535>***] | [policy route-policy** *<WORD>***] | [rip authentication key-chain** *<WORD>* **| mode md5 | text string 0** *<WORD>* **| 7** *<WORD>* **|** *<WORD>* **| split-horizon disable | poison-reverse] |**

Configure IP parameters.

IP address/IP mask—Configure the IP address/mask of this interface.

secondary—add secondary or ip aliasing address for this interface.

DHCP—your address is assigned from a DHCP server.

DDNS—
Service—use dyndns
login/password—configure the login id and password for the dnydns server.
Host/host-group—Hostname/list of hostnames registered with the DDNS service.

skip—skip everything before this on the given URL.
Use-web URL—This field should be left blank.

DHCP client —
Class ID:

- Auto
- Line

Specify a Class-id string, truncated to 200 characters. This same string or text will be configured on the server side and associated with an address to give the client.

Client ID:
This can be configured to be the Ethernet interface number, ASCII text, Hex string or set to Auto.

option—60—Vendor class identifier<oem-name>:<model>:<serial#> in ASCII
Router example: Perle:IRG5541:350-01T00003

Hostname:
Specify a value for hostname option.

DHCP–relay—set DHCP-relay for this interface.

DNS dhcp—use DNS servers received from DHCP server for specified interface

Firewall—set firewall for inbound, traffic destined for this router or outbound traffic.

health-profile—use this health profile for this interface, configure a nexthop and priority and interface.

OSPF— authentication/authentication-key— enables message-digest authentication, text, or null. Authentication-key 0 | 7 <WORD>.

cost—Configure a default metric to be applied to routes being distributed into OSPF.
Range is 0 to 16777214
Default is none

dead-interval—Configure the interval during which at least one hello packet must be received from a neighbor before the router declares that neighbor as down (dead).) As with the hello interval, this value must be the same for all routers attached to a common network.
Default is 4 times the hello interval
Default is 40 seconds

hello interval—Configure the hello packet time interval for hello packets sent on an interface.
Default is 10 seconds

message-digest-key—Configure a password used by neighboring routers for simple password authentication. It can be any continuous string of up to eight characters. There is no default value.

- None—no password
- Key-ID—Configure an authentication key
- md5—Identifies the key (password) used between this router and neighboring routers for MD5

authentication

- 0-unencrypted key will follow
- specifies a hidden key will follow
- specifies a password (key) will follow (max 16 characters).
  The default is none

mtu-ignore—By default, OSPF checks whether neighbors are using the same MTU on a common interface. Use this

command to disable this check and allow adjacencies when the MTU value differs between OSPF neighbors.

network—

- broadcast—a designated router and backup designated router are elected using OSPF multicasting capabilities point-to-multipoint— configures selected routers with neighbor/cost parameters, identifying a specific cost for the connection to the specified peer neighbors and multicast is not required. Routers on an interface becoming neighbors should match the network type all

- point-to-point—there are only two neighbors and multicast is not required. Routers on an interface becoming neighbors should match the network type all. (most common type)

- point-to-multipoint—directs the network to treats point-to-multipoint networks as a collective of point-to-point links. Point-to-Multipoint networks do not maintain a DR/BDR relationship. Point-to-Multipoint networks advertise a hot route for all the frame-relay endpoints.

- non-broadcast—use this type of network on networks having no broadcast/multicast capability, such as frame-relay, ATM, SMDS, & X.25. The key point is that these layer 2 protocols are unable to send broadcasts/multicasts

priority—a router with a high priority will always win the DR/BDR election process.
Priority Range is 0-255
Default is 1

retransmit-interval—Time in seconds between link state advertisement retransmissions for adjacencies belonging to the interface, The expected round-trip delay between any two routers in the attached network.
Range is 1–65535
Default is 5 seconds

	transmit-delay—configure the transmit delay. The estimated time in seconds required to transmit a link state update packet on the interface.
	Link state advertisements in the update packet have their age incremented by this amount before transmission. Range is 1–65535 Default is 1 seconds
	policy route-policy—enable this policy route for this interface.
	rip—enable split horizon to prevent a routing loop in your network. Basically, information about the routing for a particular packet is never sent back in the direction from which it was received.
	Default is enabled
ipsec restrict |	Restricts IPsec on this interface.

ipv6 [address *<X:X:X:X::X/ <0-128>* **eui-64	dhcp]	[enable]	[firewall in	out	local** *<WORD>*] **| [nd dad attempts** *<0-600>* **| managed config-flag	other-config-flag	prefix** *<X:X:X:X::X/<0-128> <0-4294967294>* **| infinite| no-autoconfig	no-onlink]	ra dns server** *<X:X:X:X::X>* **| hop-limit** *<1-255>* **| unspecified	interval** *<4-1800> <3-1350>* **| lifetime** *<0> <4-9000>* **| suppress	reachable time** *<0-3600000>* **| retransmission-time** *<0-3600000>* **| [router-preference high	low	medium]	[ospf cost** *<1-65535>* **| [dead-interval** *<1-65535>*] **| [hello-interval** *<1-65535>*] **| [ifmtu]	instance-id** *<0-255>*] **| [mtu-ignore]	[network broadcast	point-to-point]	[passive]	priority** *<0-255>* **| [retransmit-interval** *<1-65535>* **| [transmit-delay** *<1-65535>*] **| [policy route-policy** *<WORD>*] **| [rip enable	split-horizon	disable poisoned-reverse**		Configure IPv6 parameters. **IPv6 address/eui-64 or DHCP**— configure the IPv6 address and prefix length or obtain an IPv6 address using DHCP **enable**—enable IPv6 on this interface. **firewall**—set firewall for inbound, traffic destined for this router or outbound traffic. **nd**—IPv6 Interface Neighbor Discovery sub-commands • dad (duplicate address detection) attempts—To check the uniqueness of an IPv6 address, a node sends Neighbor Solicitation messages. Use this command to specify the number of consecutive Neighbor Solicitation messages (dad_attempts) to be sent before this address can be configured. Range 1–600 Default is 1 • managed config flags—specify whether hosts use the administrated protocol for address auto-configuration. Default is disabled (host uses stateless) • other-config-flags—specify whether hosts use the administrated protocol for non-address auto-configuration information. Default is disabled (hosts use stateless auto-configuration of no-address information

- prefix—specifies the IPv6 prefix advertised on the interface Configure the prefix length. Range is 0–128

no-autoconfig—A prefix is onlink when it is assigned to an interface on a specified link. Enable or disable prefix for onlink determination.
Default is off

no-onlink—The sending router can indicate that a prefix is to be used for address autoconfiguration by setting the autonomous flag and specifying a nonzero Valid Lifetime value for the prefix.
Default is off

ra—Router Advertisement Control

dns server—specify the name server in RA

hop-limit—Specifies the Hop Count field of the IP header for outgoing (unicast) IP packets.
Range is 1–255
Default is 64

interval—Specifies the maximum/minimum time allowed between sending unsolicited multicast router advertisements.

Range of minimum is 3 to *0.75 max (dynamic range)
Default maximum 600 seconds, minimum is 0.33*max
Range is 1–1800 in seconds

lifetime—The lifetime associated with the default router in seconds. A value of 0 indicates that the router is not a default router and doesn't appear on the default router list. The router lifetime applies only to the router's usefulness as a default router; it does not apply to information contained in other message fields or options.
Range is 4-1800 seconds

Minimum interval is 3-1350 in seconds
Default is 1800 seconds
0 = not a default route

suppress—enable or disable IPv6 Router advertisements.
Default is send router advertisements

reachable time—specifies the length in time (milliseconds) a node assumes a neighbor is reachable after receiving a reachability confirmation
Default is 0 (unspecified by this router)
Range is 0-360000 milliseconds

retransmission-time—The retransmission timer is used to control the time (in milliseconds) between retransmissions of neighbor solicitation messages from the user equipment (UE).
Range 0–3600000 in milliseconds
Default is 0

router-preference—set the default router preference. A High value means this router will be preferred.

- **High**
- **Medium**
- **Low**

Default is medium

policy route-policy—enable this policy route for this interface.

Range is 0 to 16777214
Default is none

Default is 40 seconds

with the MTU value set on the interface.
rip—enable split horizon to prevent a routing loop in your network. Basically, information about the routing for a particular packet is never sent back in the direction from which it was received.

Default is enabled

OSPF—
cost—Configure a default metric to be applied to routes being distributed into OSPF.
Range is 0 to 16777214
Default is none

dead-interval—Configure the interval during which at least one hello packet must be received from a neighbor before the router declares that neighbor as down (dead). As with the hello interval, this value must be the same for all routers attached to a common network.
Default is 4 times the hello interval

hello interval—Configure the hello packet time interval for hello packets sent on an interface.
The default is 10 seconds.

ifmtu—The range is dynamic (depending on the interface type) and it will match.
instance-id—instance ID for this interface.
Values are 0–255

mtu-ignore—By default, OSPF checks whether neighbors are using the same MTU on a common interface. Use this command to disable this check and allow adjacencies when the MTU value differs between OSPF neighbors.

network—
- broadcast—Specify OSPF broadcast multi-access network
- point-to-point—Specify OSPF point-to-point network

passive—no adjacency will be formed on this interface.

priority—A router with a high priority will always win the DR/BDR election process.
Priority Range is 0-255
Default is 1

	retransmit-interval—configure the time between retransmitting lost link advertisements) Time in seconds between link state advertisement retransmissions for adjacencies belonging to the interface, The expected round-trip delay between any two routers in the attached network Range is 1–65535 Default is 5 second
	transmit-delay—configure the transmit delay. The estimated time in seconds required to transmit a link state update packet on the interface. Link state advertisements in the update packet have their age incremented by this amount before transmission. Range is 1–65535 Default is 1 second
logging event interface-ip | **link-status** |	Configure interface logging events and link status.
mac access-group *<WORD>* **deny** | **disable** | **permit** |	Configure mac access-group parameters for this interface.
mtu *<68-1500>* |	Configure maximum transmission unit (MTU). Values are 68-1500 bytes Default is 1500 bytes

ntp [broadcast client | destination *<A.B.C.D>***] | [key** *<1-65534>***] | [minpoll** *<4-17>***] | [version** *<1-4>***] | [disable] | [multicast [***<A.B.C.D>* | *<X:X:X:X::X>***] | client** *<A.B.C.D>* **|** *<X:X:X:X::X>***] | [key** *<1-65534>***] | [minpoll** *<4-17>***] | [version** *<1-4>***] |**	Network Time Protocol (NTP) is used distribute and maintain synchronization of time information between nodes in a network. The router can provide the time to NTP/SNTP capable client devices (or other Perle routers and IOLAN's etc). You can run the SNTP client and the NTP server concurrently on your system. Therefore you can obtain time from an outside source and serve that time to the devices connected to the ruter. Configure Network Time Protocol (NTP) for this interface. **broadcast client**—listens to NTP broadcasts **destination broadcast**—Configure broadcast destination address **multicast** client—listens to NTP multicasts **destination multicast**—multicast IPv4 or IPv6 address **key**—Configure broadcast authentication key **versions** 1 to 4 are support. **minimum poll interval** is 4(16s), 5(32 s), 6 (1m 4s), 7(2m,8s), 8(4m,16s), 9(8m, 32s), 10 (17,m, 4s), 11 (34,m,8s) Default is 6
role lan | trusted | wan |	Select the role for this interface. **LAN**—management access is from the LAN side **WAN**—management access is from the WAN side **Trusted**—management access from either the LAN or WAN side
service-policy in *<WORD>* **| out** *<WORD>***|**	Assigns interface service policy. Configure for the policy for inbound or outbound traffic.
shutdown |	Shutdown this interface.
snmp trap interface-ip | link-status |	Configure interface SNMP traps and link status.
zone-member security *<WORD>***}**	Configure this interface as a member of this zone security.

Command Modes	Perle(config-if)#

Usage Guidelines

Use this command to configure parameters for the bridge interface.

Examples

This example enables an IP address on bvi 10.

Perle>enable
Perle#config
Perle#interface bvi 10
(config-if)#ip address 172.16.113.45 255.255.0.0

Syntax Description	**(config-if)#cellular**
{**alarm profile** *<WORD>* │	Use this alarm profile for this interface.
description *<LINE>* │	Configure interface description.
idle-time *<LINE>* │	Configure time to drop the "on demand" connection.
ip [ddns service dyndns login *<WORD>* **password** *<WORD>* **host** *<WORD>* **| host-group** *<WORD>* **| use-web skip** *<WORD>* **| url** *<WORD>***] | [dhcp-relay] | [dns dhcp] | [firewall in | local | out** *<WORD>***] | [health-profile** *<WORD>* **nexthop** *<A.B.C.D>***] | [ospf authentication message-digest | null | [authentication-key 0** *<WORD>* **| 7** *<WORD>* **|** *<WORD>***] | [cost** *<1-65535>***] | [dead-interval** *<1-65535>***] | [hello-interval** *<1-65535>***] | [message-digest-key** *<1-255>***>md5 0** *<WORD>* **| 7** *<WORD>* **|** *<WORD>***] | [mtu-**	Configure IP parameters. **DDNS— Service—**use dyndns login/password—configure the login id and password for the dnydns server. **Host/host-group—**Hostname/list of hostnames registered with the DDNS service. **skip—**skip everything before this ont he given URL. **DHCP–relay—**set DHCP-relay for this interface. **DNS dhcp—**use DNS servers received from DHCP server for specified interface. **Firewall—**set firewall for inbound, traffic destined for this router or outbound traffic.

ignore] | [network broadcast | non-broadcast | point-to-point | point-to-multipoint] | [priority *<0-255>*] | [retransmit-interval *<1-65535>*] | [transmit-delay *<1-65535>*] | [policy route-policy *<WORD>*] | [rip authentication key-chain *<WORD>* | mode md5 | text string 0 *<WORD>* | 7 *<WORD>* | *<WORD>* | split-horizon disable | poison-reverse] |

Configure IP parameters.

DDNS—

Service—use dyndns login/password—configure the login id and password for the dnydns server.

Host/host-group—Hostname/list of hostnames registered with the DDNS service.

skip—skip everything before this ont he given URL.

DHCP–relay—set DHCP-relay for this interface.

DNS dhcp—use DNS servers received from DHCP server for specified interface.

Firewall—set firewall for inbound, traffic destined for this router or outbound traffic.

health-profile—use this health profile for this interface, configure a nexthop, priority and interface.

OSPF—

authentication/authentication-key—enables message-digest authentication, text, or null. Authentication-key 0 | 7 <WORD>.

cost—Configure a default metric to be applied to routes being distributed into OSPF.
Range is 0 to 16777214
Default is none

dead-interval—Configure the interval during which at least one hello packet must be received from a neighbor before the router declares that neighbor as down (dead).) As with the hello interval, this value must be the same for all routers attached to a common network.
Default is 4 times the hello interval
Default is 40 seconds

hello interval—Configure the hello packet time interval for hello packets sent on an interface.
The default is 10 seconds.

message-digest-key—Configure a password used by neighboring routers for simple password authentication. It can be any continuous string of up to eight characters. There is no default value.

- None—no password
- Key-ID—Configure an authentication key

- md5—Identifies the key (password) used between this router and neighboring routers for MD5 authentication

mtu-ignore—By default, OSPF checks whether neighbors are using the same MTU on a common interface. Use this command to disable this check and allow adjacencies when the MTU value differs between OSPF neighbors.

network—

- broadcast—a designated router and backup designated router are elected using OSPF multicasting capabilities point-to-multipoint— configures selected routers with neighbor/cost parameters, identifying a specific cost for the connection to the specified peer neighbors and multicast is not required. Routers on an interface becoming neighbors should match the network type all

- point-to-point—there are only two neighbors and multicast is not required. Routers on an interface becoming neighbors should match the network type all. (most common type)

- point-to-multipoint—directs the network to treats point-to-multipoint networks as a collective of point-to-point links. Point-to-Multipoint networks do not maintain a DR/BDR relationship. Point-to-Multipoint networks advertise a hot route for all the frame-relay endpoints.

- non-broadcast—use this type of network on networks having no broadcast/multicast capability, such as frame-relay, ATM, SMDS, & X.25. The key point is that these layer 2 protocols are unable to send broadcasts/multicasts

priority—a router with a high priority will always win the DR/BDR election process. Priority Range is 0-255
Default is 1

retransmit-interval—configure the time between retransmitting lost link advertisements) Time in seconds between link state advertisement retransmissions for adjacencies belonging to the interface, The expected round-trip delay between any two routers in the attached network.

	Range is 1–65535 Default is 5 second Default is 1 seconds
	transmit-delay—configure the transmit delay. The estimated time in seconds required to transmit a link state update packet on the interface. Link state advertisements in the update packet have their age incremented by this amount before transmission. Range is 1–65535
	policy route-policy—enable this policy route for this interface.
	rip—enable split horizon to prevent a routing loop in your network. Basically, information about the routing for a particular packet is never sent back in the direction from which it was received.
	Default is enabled
ipsec restrict |	Restrict IPsec on this interface.

ipv6 [autoconfig] | **[enable]** | **[firewall in** | **out** | **local** *<WORD>*] | **[ospf cost** *<1-65535>* | **dead-interval** *<1-65535>* | **hello-interval** *<1-65535>* | **ifmtu** | **instance-id** *<0-255>* | **mtu-ignore** | **passive** | **priority** *<0-255>* | **retransmit-interval** *<1-65535>* | **transmit-delay** *<1-65535>*] | **[policy route-policy** *<WORD>*] | **[rip enable** | **split-horizon** | **disable poisoned-reverse]** |	Configure IPv6 parameters. **auto-config**—obtains an address using autoconfiguration **enable**—enable IPv6 on this interface **firewall**—set firewall for inbound, traffic destined for this router or outbound traffic. **OSPF**— **cost**—Configure a default metric to be applied to routes being distributed into OSPF. Range is 0–16777214 Default is none **dead-interval**—Configure the interval during which at least one hello packet must be received from a neighbor before the router declares that neighbor as down (dead).) As with the hello interval, this value must be the same for all routers attached to a common network. Default is 4 times the hello interval Default is 40 seconds **hello interval**—Configure the hello packet time interval for hello packets sent on an interface. The default is 10 seconds. **ifmtu**—The range is dynamic (depending on the interface type) and it will match with the MTU value set on the interface. **instance-id**—instance ID for this interface. Values are 0–255

mtu-ignore—By default, OSPF checks whether neighbors are using the same MTU on a common interface. Use this command to disable this check and allow adjacencies when the MTU value differs between OSPF neighbors.

network—

- broadcast–Specify OSPF broadcast multi-access network
- point-to-point–Specify OSPF point-to-point network

passive—no adjacency will be formed on this interface.

priority—A router with a high priority will always win the DR/BDR election process.
Priority Range is 0-255
Default is 1

retransmit-interval—configure the time between retransmitting lost link advertisements) Time in seconds between link state advertisement retransmissions for adjacencies belonging to the interface, The expected round-trip delay between any two routers in the attached network.
Range is 1–65535
Default is 5 second

transmit-delay—configure the transmit delay. The estimated time in seconds required to transmit a link state update packet on the interface. Link state advertisements in the update packet have their age incremented by this amount before transmission.
Range is 1–65535
Default is 1 seconds

policy route-policy—enable this policy route for this interface.

rip—enable split horizon to prevent a routing loop in your network. Basically, information about the routing for a particular packet is never sent back in the direction from which it was received.
Default is enabled

logging event interface-ip | link-status |	Configure interface logging events and link status.

**monitor-traffic both	receive	transmit]	**	Monitors the traffic for on demand feature. Traffic can be monitored for: • in • out • both
mtu *<64-9000>* **|**	Sets Maximum Transmission Unit. (MTU). Values are 64-9000 bytes Default is 1460 bytes
**ntp [broadcast client	destination** *<A.B.C.D>***]	[key** *<1-65534>***]	[minpoll** *<4-17>***]	[version** *<1-4>***]	[disable]	[multicast [**<*A.B.C.D>* **|** *<X:X:X:X::X>* **| client** *<A.B.C.D>* **|** *<X:X:X:X::X>***]	[key** *<1-65534>***]	[minpoll** *<4-17>***]	[version** *<1-4>***] |**	Network Time Protocol (NTP) is used distribute and maintain synchronization of time information between nodes in a network The router can provide the time to NTP/SNTP capable client devices (or other Perle routers and IOLAN's etc). You can run the SNTP client and the NTP server concurrently on your system. Therefore you can obtain time from an outside source and serve that time to the devices connected to the router. Configure Network Time Protocol (NTP) for this interface. **broadcast client**—listens to NTP broadcasts. **destination broadcast**—Configure broadcast destination address. **multicast** client—listens to NTP multicasts. **destination multicast**—multicast IPv4 or IPv6 address. **key**—Configure broadcast authentication key. **versions** 1 to 4 are support. **minimum poll interval** is 4(16s), 5(32 s), 6 (1m 4s), 7(2m,8s), 8(4m,16s), 9(8m, 32s), 10 (17,m, 4s), 11 (34,m,8s). Default is 6
on-demand |	On demand feature brings up the interface when there is data to be sent or received only.
service-policy in *<WORD>* **| out** *<WORD>* **|**	Assigns traffic policy to this interface. Select whether the policy will apply to inbound or outbound traffic.
**snmp trap interface-ip	link-status	**	Sets interface SNMP traps and link status.
start-connected |	Establishes LTE data connection after reload or power up.
zone-member security *<WORD>*}	This interface is a member of this zone security.

Command Modes	Perle(config-if)#

Usage Guidelines

Use this command to configure cellular profile parameters.

Examples

This example starts cellular connection after the router reboots.

Perle(config)# interface cellular 0
Perle(config-if)#start-connected

Configure IP parameters.

IP address/IP mask—Configure the IP address/mask of this interface.

DDNS—

Service—use dyndns login/password—configure the login id and password for the dnydns server.

Host/host-group—Hostname/list of hostnames registered with the DDNS service.

skip—skip everything before this ont he given URL.

Use-web URL—Enter the URL that you want to obtain an IP address from. This allows the router to be seen on the Internet as a public address.

DHCP–relay—set DHCP-relay for this interface.

Firewall—set firewall for inbound, traffic destined for this router or outbound traffic

health-profile—use this health profile for this interface, configure a nexthop interface.

OSPF—

authentication/authentication-key— enables message-digest authentication, text, or null. Authentication-key 0 | 7 <WORD>.

cost—Configure a default metric to be applied to routes being distributed into

dead-interval—Configure the interval during which at least one hello packet must be received from a neighbor before the router declares that neighbor as down (dead).) As with the hello interval, this value must be the same for all routers attached to a common network.
Default is 4 times the hello interval
Default is 40 seconds

hello interval—Configure the hello packet time interval for hello packets sent on an interface.
The default is 10 seconds.

message-digest-key—Configure a password used by neighboring routers for simple password authentication. It can be any continuous string of up to eight characters. There is no default value.

- None—no password
- Key-ID—Configure an authentication key
- md5—Identifies the key (password) used between this router and neighboring routers for MD5

authentication.

- 0-unencrypted key will follow
- specifies a hidden key will follow
- specifies a password (key) will follow (max 16 characters).
  The default is none

mtu-ignore—By default, OSPF checks whether neighbors are using the same MTU on a common interface. Use this command to disable this check and allow adjacencies when the MTU value differs between OSPF neighbors.

network—

- broadcast—a designated router and backup designated router are elected using OSPF multicasting capabilities point-to-multipoint— configures selected routers with neighbor/cost parameters, identifying a specific cost for the connection to the specified peer neighbors and multicast is not required. Routers on an interface becoming neighbors should match the network type all.

- point-to-point—there are only two neighbors and multicast is not required. Routers on an interface becoming neighbors should match the network type all. (most common type)
- point-to-multipoint—directs the network to treats point-to-multipoint networks as a collective of point-to-point links. Point-to-Multipoint networks do not maintain a DR/BDR relationship.
- Point-to-Multipoint networks advertise a hot route for all the frame-relay endpoints.
- non-broadcast—use this type of network on networks having no broadcast/multicast capability, such as frame-relay, ATM, SMDS, & X.25. The key point is that these layer 2 protocols are unable to send broadcasts/multicasts

priority—a router with a high priority will always win the DR/BDR election process.
Priority Range is 0-255
Default is 1

retransmit-interval—configure the time between retransmitting lost link advertisements) Time in seconds between link state advertisement retransmissions for adjacencies belonging to the interface, The expected round-trip delay between any two routers in the attached network.
Range is 1–65535
Default is 5 second

transmit-delay—configure the transmit delay. The estimated time in seconds required to transmit a link state update packet on the interface. Link state advertisements in the update packet have their age incremented by this amount before transmission.
Range is 1–65535
Default is 1 seconds

policy route-policy—enable this policy route for this interface.

rip—enable split horizon to prevent a routing loop in your network. Basically, information about the routing for a particular packet is never sent back in the direction from which it was received.

Default is enabled

ipsec restrict | Restrict IPsec on this interface.

ipv6 [address autoconfig] | **[enable]** | **[firewall in | out | local** *<WORD>*] | **[ospf [cost** *<1-65535>*] | **[dead-interval** *<1-65535>*] | **[hello-interval** *<1-65535>*] | **ifmtu** | **[instance-id]** | **[mtu-ignore]** |**[network broadcast | point-to-point]** | **[priority** *<0-255>*] | **[retransmit-interval** *<1-65535>*] | **[transmit-delay** *<1-65535>*] | **[policy route-policy** *<WORD>*] | **[rip enable | split-horizon disable | poisoned-reverse]** |	Configure IPv6 parameters. **auto-config**—obtains an address using autoconfiguration. **enable**—enable IPv6 on this interface **firewall**—set firewall for inbound, traffic destined for this router or outbound traffic. **OSPF—** **cost**—Configure a default metric to be applied to routes being distributed into OSPF. Range is 0–16777214 Default is none **dead-interval**—Configure the interval during which at least one hello packet must be received from a neighbor before the router declares that neighbor as down (dead).) As with the hello interval, this value must be the same for all routers attached to a common network. Default is 4 times the hello interval Default is 40 seconds **hello interval**—Configure the hello packet time interval for hello packets sent on an interface. The default is 10 seconds. **ifmtu**—The range is dynamic (depending on the interface type) and it will match with the MTU value set on the interface. **instance-id**—instance ID for this interface. Values are 0–255 **mtu-ignore**—By default, OSPF checks whether neighbors are using the same MTU on a common interface. Use this command to disable this check and allow adjacencies when the MTU value differs between OSPF neighbors. **Network—** ● broadcast–Specify OSPF broadcast multi-access network ● point-to-point–Specify OSPF point-to-point **passive**—no adjacency will be formed on this interface. **priority**—A router with a high priority will always win the DR/BDR election process. Priority Range is 0-255 Default is 1

	retransmit-interval—configure the time between retransmitting lost link advertisements) Time in seconds between link state advertisement retransmissions for adjacencies belonging to the interface, The expected round-trip delay between any two routers in the attached network. Range is 1–65535 Default is 5 second
	transmit-delay—configure the transmit delay. The estimated time in seconds required to transmit a link state update packet on the interface. Link state advertisements in the update packet have their age incremented by this amount before transmission. Range is 1–65535
	policy route-policy—enable this policy route for this interface.
	rip—enable split horizon to prevent a routing loop in your network. Basically, information about the routing for a particular packet is never sent back in the direction from which it was received Default is enabled
logging event interface-ip | **link-status** |	Configure interface logging events and link status.
mtu *<64-1500>* |	Sets Maximum Transmission Unit (MTU). Values are 64-1500 bytes Default is 1492
ntp [broadcast client | **destination** *<A.B.C.D>***]** | **[key** *<1-65534>***]** | **[minpoll** *<4-17>***]** | **[version** *<1-4>***]** | **[disable]** | **[multicast [**<A.B.C.D> | *<X:X:X:X::X>* | **client** *<A.B.C.D>* | *<X:X:X:X::X>***]** | **[key** *<1-65534>***]** | **[minpoll** *<4-17>***]** | **[version** *<1-4>***]** |	Network Time Protocol (NTP) is used distribute and maintain synchronization of time information between nodes in a network. The router can provide the time to NTP/SNTP capable client devices (or other Perle routers and IOLAN's etc). You can run the SNTP client and the NTP server concurrently on your system. Therefore you can obtain time from an outside source and serve that time to the devices connected to the router. Configure Network Time Protocol (NTP) for this interface.

	broadcast client—listens to NTP broadcasts.
	destination broadcast—Configure broadcast destination address.
	multicast client—listens to NTP multicasts.
	destination multicast—multicast IPv4 or IPv6 address.
	key—Configure broadcast authentication key.
	versions 1 to 4 are support. **minimum poll interval** is 4(16s), 5(32 s), 6 (1m 4s), 7(2m,8s), 8(4m,16s), 9(8m, 32s), 10 (17,m, 4s), 11 (34,m,8s) Default is 6

Syntax Description	(config-if)#dot11radio)
{**arp disable-arp-filter** | **enable-arp-accept** | **enable-arp-announce** | **enable-arp-ignore** | **enable-proxy-arp** |	Configure ARP parameters.
	Disable ARP filter—If enabled the router responds to same ARP requests coming from multiple interfaces.
	Enable ARP Accept—Define behavior for gratuitous ARP frames who's IP is not already present in the ARP table: 0—don't create new entries in the ARP table 1—create new entries in the ARP table.
	Enable ARP Announce—Define different restriction levels for announcing the local source IP address from IP packets in ARP requests sent on interface.
	• 0—(default) Use any local address, configured on any interface
	• 1—Try to avoid local addresses that are not in the target's subnet for this interface
	Enable ARP Ignore—Define different restriction levels for announcing the local source IP address from IP packets in ARP requests sent on interface.
	• 0—(default) Use any local address, configured on any interface

	• 1—Try to avoid local addresses that are not in the target's subnet for this interface
	• **Enable Proxy ARP**—Enable Proxy ARP if you need your router to respond to local networks with its MAC address. Default is Disabled
	Enable ARP Ignore—Define different restriction levels for announcing the local source IP address from IP packets in ARP requests sent on interface.
	• 0—(default) Use any local address, configured on any interface
	• 1—Try to avoid local addresses that are not in the target's subnet for this interface
	Enable Proxy ARP—Enable Proxy ARP if you need your router to respond to local networks with its MAC address. Default is Disabled
bridge-group *<1-9999>* |	Sets transparent bridging interface parameters.
channel *<1-11>* |	Sets the radio frequency.
description *<LINE>* |	Description for this interface.
dot11ac [antenna-pattern-fixed] | [center-channel-frequency *<34-173>***] | [channel-width vht40 | vht80] | [ldpc] | [max-mpdu** *<11454> <7991>***] | [max-mpdu-exp** *<1-7>***] | [require-vht] | [short-gi** *<20 | 40 | 80>***] | [stbc rx-stbc rx-stbc-1 | tx-stbc]** |	Configure dot11ac vht mode.
dot11n [40mhz-incapable] | [a-msdu *<7935>***] | [auto-power-save] | [channel-width ht40+ | ht40-] | [dsss-cck-40mhz] | [ldpc] | [require-ht] | [short-gi** *<20 | 40>***] | stbc rx-stbc rx-stbc-1 | tx-stbc]** |	Configure dot11n ht mode.

ip [address *<A.B.C.D>* *<A.B.C.D>* | dhcp] | [ddns service dyndns login *<WORD>* password *<WORD>* host *<WORD>* host-group *<WORD>* | use-web skip *<WORD>* | url *<WORD>*] | [dhcp client class-id *<LINE>* | auto | client-id ethernet *<1–5>* | ascii *<WORD>* | auto | hex *<Hex-String>* | hostname *<WORD>*] | [dhcp-relay] | [dns dhcp] | [firewall in | out | local *<WORD>*] | [health-profile *<WORD>* nexthop *<A.B.C.D>*] | [ospf authentication message-digest | null] | [authentication-key 0 *<WORD>* | 7 *<WORD>* | *<WORD>*] | [cost *<1-65535>*] | [dead-interval *<1-65535>*] | [hello-interval *<1-65535>*] | [message-digest-key *<1-255>* md5 0 *<WORD>* | 7 *<WORD>* | *<WORD>*] | [mtu-ignore] | [network broadcast | non-broadcast | point-to-point | point-to-multipoint] | [priority *<0-255>*] | [retransmit-interval *<1-65535>*] | [transmit-delay *<1-65535>*] | [policy route-policy *<WORD>*] | [rip authentication key-chain *<WORD>* | mode md5 | text string 0 *<WORD>* | 7 *<WORD>* | *<WORD>* | split-horizon disable | poison-reverse] |

Configure IP parameters.

IP address/IP mask—Configure the IP address/mask of this interface.

secondary—add secondary or ip aliasing address for this interface.

DHCP—your address is assigned from a DHCP server.

DDNS—

Service—use dyndns login/password—configure the login id and password for the dnydns server.

Host/host-group—Hostname/list of hostnames registered with the DDNS service.

skip—skip everything before this on the given URL.

Use-web URL—Enter the URL that you want to obtain an IP address from. This allows the router to be seen on the Internet as a public address.

DHCP client—

Class ID:

- Auto
- Line

Specify a Hex string or ASCII text. This same hex string or text would be configured on the server side and associated with an address to give the client.

Client ID:
This can be configured to be the Ethernet interface number, ASCII text, Hex string or set to Auto.

option—60—Vendor class identifier<oem-name>:<model>:<serial#> in ASCII Router example: Perle:IRG5541:350-01T00003

Hostname:
Specify a value for hostname option.

DHCP–relay—set DHCP-relay for this interface.

DNS dhcp—use DNS servers received from DHCP server for specified interface

Firewall—set firewall for inbound, traffic destined for this router or outbound traffic.

health-profile—use this health profile for this interface, configure a nexthop interface.

skip—skip everything before this on the given URL

Use-web URL—Enter the URL that you want to obtain an IP address from. This allows the router to be seen on the Internet as a public address.

OSPF— authentication/authentication-key—enables message-digest authentication, text, or null. Authentication-key 0 | 7 <WORD>.

cost—Configure a default metric to be applied to routes being distributed into OSPF. Range is 0 to 16777214
Default is none

dead-interval—Configure the interval during which at least one hello packet must be received from a neighbor before the router declares that neighbor as down (dead).) As with the hello interval, this value must be the same for all routers attached to a common network.

Default is 4 times the hello interval
Default is 40 seconds

hello interval—Configure the hello packet time interval for hello packets sent on an interface.
The default is 10 seconds.

message-digest-key—Configure a password used by neighboring routers for simple password authentication. It can be any continuous string of up to eight characters. There is no default value.

● None—no password
● Key-ID—Configure an authentication key
● md5—Identifies the key (password) used between this router and neighboring routers for MD5 authentication
  ● 0-unencrypted key will follow
  ● specifies a hidden key will follow
  ● specifies a password (key) will follow (max 16 characters).
    The default is none

mtu-ignore—By default, OSPF checks whether neighbors are using the same MTU on a common interface. Use this command to disable this check and allow adjacencies when the MTU value differs between OSPF neighbors.

network—

- broadcast—a designated router and backup designated router are elected using OSPF multicasting capabilities point-to-multipoint— configures selected routers with neighbor/cost parameters, identifying a specific cost for the connection to the specified peer neighbors and multicast is not required. Routers on an interface becoming neighbors should match the network type all

- point-to-point—there are only two neighbors and multicast is not required. Routers on an interface becoming neighbors should match the network type all. (most common type)

- point-to-multipoint—directs the network to treats point-to-multipoint networks as a collective of point-to-point links. Point-to-Multipoint networks do not maintain a DR/BDR relationship. Point-to-Multipoint networks advertise a hot route for all the frame-relay endpoints.

- non-broadcast—use this type of network on networks having no broadcast/multicast capability, such as frame-relay, ATM, SMDS, & X.25. The key point is that these layer 2 protocols are unable to send broadcasts/multicasts

retransmit-interval—configure the time between retransmitting lost link advertisements) Time in seconds between link state advertisement retransmissions for adjacencies belonging to the interface, The expected round-trip delay between any two routers in the attached network.
Range is 1–65535
Default is 5 second

transmit-delay—configure the transmit delay. The estimated time in seconds required to transmit a link state update packet on the interface. Link state advertisements in the update packet have their age incremented by this amount before transmission.

	Range is 1–65535 Default is 1 seconds **policy route-policy**—enable this policy route for this interface. **rip**—enable split horizon to prevent a routing loop in your network. Basically, information about the routing for a particular packet is never sent back in the direction from which it was received. Default is enabled
ipsec restrict |	Restrict IPsec on this interface.
ipv6 [address dhcp] | [enable] | [firewall in | out | local *<WORD>*] | **[nd dad attempts** *<0-600>* | **managed config-flag | other-config-flag | prefix** *<X:X:X:X::X/<0-128> <0-4294967294>* | **infinite] | [ra dns server** *<X:X:X:X::X>* | **[hop-limit** *<1-255>* | **unspecified | interval** *<4-1800> <3-1350>*] | **[lifetime** *<0><4-9000>*] | **[suppress] | [reachable time** *<0-3600000>*] | **[retransmission-time** *<0-3600000>*] | **[router-preference high | low |medium] | [ospf cost** *<1-65535>* | **[dead-interval** *<1-65535>*] | **[hello-interval** *<1-65535>*] | **[ifmtu] | [instance-id** *<0-255>*] | **[mtu-ignore]| [passive] | [priority** *<0-255>*] | **[retransmit-interval** *<1-65535>*] | **[transmit-delay** *<1-65535>*] | **[policy route-policy** *<WORD>*]** | [rip enable | split-horizon | disable poisoned-reverse]** |	Configure IPv6 parameters. **address**—use DHCP to obtain address. **enable**—enable IPv6 on this interface. **firewall**—set firewall for inbound, traffic destined for this router or outbound traffic. **nd**—IPv6 Interface Neighbor Discovery sub-commands • dad (duplicate address detection) attempts—To check the uniqueness of an IPv6 address, a node sends Neighbor Solicitation messages. Use this command to specify the number of consecutive Neighbor Solicitation messages (dad_attempts) to be sent before this address can be configured Range 1–600 Default is 1 • managed config flags—specify whether hosts use the administrated protocol for address auto-configuration. Default is disabled (host uses stateless) • other-config-flags—specify whether hosts use the administrated protocol for non-address auto-configuration information. Default is disabled (hosts use stateless auto-configuration of no-address information • prefix—specifies the IPv6 prefix advertised on the interface Configure the prefix length. Range is 0–128

no-autoconfig—A prefix is onlink when it is assigned to an interface on a specified link. Enable or disable prefix for onlink determination.
Default is off

no-onlink—The sending router can indicate that a prefix is to be used for address autoconfiguration by setting the autonomous flag and specifying a nonzero Valid Lifetime value for the prefix.
Default is off

ra—Router Advertisement Control

dns server—specify the name server in RA.

hop-limit—Specifies the Hop Count field of the IP header for outgoing (unicast) IP packets.
Range is 1–255
Default is 64

interval—Specifies the maximum/minimum time allowed between sending unsolicited multicast router advertisements.

Range of minimum is 3 to *0.75 max (dynamic range)
Default maximum 600 seconds, minimum is 0.33*max
Range is 1–1800 in seconds

lifetime—The lifetime associated with the default router in seconds. A value of 0 indicates that the router is not a default router and doesn't appear on the default router list. The router lifetime applies only to the router's usefulness as a default router; it does not apply to information contained in other message fields or options.
Range is 1–9000 seconds
Default is 1800 seconds
0 = not a default route

suppress—enable or disable IPv6 Router advertisements.
reachable time—specifies the length in time (milliseconds) a node assumes a neighbor is reachable after receiving a reachability confirmation
Default is 0 (unspecified by this router)
Range is 0-360000 milliseconds

retransmission-time—The retransmission timer is used to control the time (in milliseconds) between retransmissions of neighbor solicitation messages from the user equipment (UE).
Range 1–3600000 in milliseconds
Default is 0

router-preference—set the default router preference. A High value means this router will be preferred.

- **High**
- **Medium**
- **Low**

Default is medium

OSPF—

cost—Configure a default metric to be applied to routes being distributed into OSPF.
dead-interval—Configure the interval during which at least one hello packet must be received from a neighbor before the router declares that neighbor as down (dead).

As with the hello interval, this value must be the same for all routers attached to a common network.

Default is 4 times the hello interval
Default is 40 seconds

hello interval—Configure the hello packet time interval for hello packets sent on an interface.
The default is 10 seconds.

ifmtu—The range is dynamic (depending on the interface type) and it will match with the MTU value set on the interface.
instance-id—instance ID for this interface. Values are 0–255

mtu-ignore—By default, OSPF checks whether neighbors are using the same MTU on a common interface. Use this command to disable this check and allow adjacencies when the MTU value differs between OSPF neighbors.

network–

- broadcast–Specify OSPF broadcast multi-access network

- point-to-point–Specify OSPF point-to-point network

passive—no adjacency will be formed on this interface.

	priority—A router with a high priority will always win the DR/BDR election process. Priority Range is 0-255 Default is 1
	retransmit-interval—configure the time between retransmitting lost link advertisements) Time in seconds between link state advertisement retransmissions for adjacencies belonging to the interface, The expected round-trip delay between any two routers in the attached network. Range is 1–65535 Default is 5 second
	transmit-delay—configure the transmit delay. The estimated time in seconds required to transmit a link state update packet on the interface. Link state advertisements in the update packet have their age incremented by this amount before transmission. Range is 1–65535 Default is 1 seconds
	policy route-policy—enable this policy route for this interface.
	rip—enable split horizon to prevent a routing loop in your network. Basically, information about the routing for a particular packet is never sent back in the direction from which it was received. Default is enabled
logging event interface-ip | **link-status** |	Configure interface logging events and link status.
mtu *<256-1500>* |	Configure Maximum Transmission Unit (MTU) size. Values are 256-1500 bytes Default is 1500 bytes
ntp [broadcast client | **destination** *<A.B.C.D>***]** | **[key** *<1-65534>***]** | **[minpoll** *<4-17>***]** | **[version** *<1-4>***]** | **[disable]** | **[multicast [**<*A.B.C.D>* | *<X:X:X:X::X>* | **client** *<A.B.C.D>* | *<X:X:X:X::X>***]** | **[key** *<1-65534>***]** | **[minpoll** *<4-17>***]** | **[version** *<1-4>***]** |	Network Time Protocol (NTP) is used distribute and maintain synchronization of time information between nodes in a network The router can provide the time to NTP/SNTP capable client devices (or other Perle routers and IOLAN's etc).You can run the SNTP client and the NTP server concurrently on your system. Therefore you can obtain time from an outside source and serve that time to the devices connected to the route.

	Configure Network Time Protocol (NTP) for this interface.
	broadcast client—listens to NTP broadcasts.
	destination broadcast—Configure broadcast destination address.
	multicast client—listens to NTP multicasts.
	destination multicast—multicast IPv4 or IPv6 address.
	key—Configure broadcast authentication key.
	versions 1 to 4 are support.
	minimum poll interval is 4(16s), 5(32 s), 6 (1m 4s), 7(2m,8s), 8(4m,16s), 9(8m, 32s), 10 (17,m, 4s), 11 (34,m,8s) Default is 6
radio-mode *<0-1>* |	Select 0 for 2.4Ghz and 1 for 5Ghz. Default is 2.4Ghz
role lan | trusted | wan |	Select the role for this interface.
	LAN—management access is from the LAN side
	WAN—management access is from the WAN side
	Trusted—management access from either the LAN or WAN side
service-policy in *<WORD>* | **out** *<WORD>* |	Assign traffic policy to this interface. Select whether the policy will apply to inbound or outbound traffic.
shutdown |	Shutdown this interface.
snmp trap interface-ip | link-status |	Configure SNMP traps for interface and link status.
ssid *<LINE>* **dot11radio** *<1-4>* |	Configure radio service set parameters.
station-role non-root | root |	Configure role of the radio.
world mode dot11d country-code *<WORD>* |	Configure an ISO 3166-1 Alpha-2 code. Two characters. Default is ac (United States)
zone-member security *<WORD>*}	This interface is a member of this zone security.
Command Modes	Perle(config-if)#

Usage Guidelines

Setup options for Dot11Radio.

Examples

This example sets up this interface to use DHCP.

Perle(config-if)# ip address dhcp

Firewall—set firewall for inbound, traffic destined for this router or outbound traffic.

Health-profile—use this health profile for this interface, configure a nexthop interface.

OSPF— authentication/authentication-key—enables message-digest authentication, text, or null. Authentication-key 0 | 7 <WORD>.

cost—Configure a default metric to be applied to routes being distributed into OSPF.

dead-interval—Configure the interval during which at least one hello packet must be received from a neighbor before the router declares that neighbor as down (dead).) As with the hello interval, this value must be the same for all routers attached to a common network.
Default is 4 times the hello interval
Default is 40 seconds

hello interval—Configure the hello packet time interval for hello packets sent on an interface.
The default is 10 seconds.

message-digest-key—Configure a password used by neighboring routers for simple password authentication. It can be any continuous string of up to eight characters. There is no default value.

- None—no password
- Key-ID—Configure an authentication key
- md5—Identifies the key (password) used between this router and neighboring routers for MD5

authentication

- 0-unencrypted key will follow
- specifies a hidden key will follow
- specifies a password (key) will follow (max 16 characters). The default is none

mtu-ignore—By default, OSPF checks whether neighbors are using the same MTU on a common interface. Use this command to disable this check and allow adjacencies when the MTU value differs between OSPF neighbors.

network—
- broadcast—a designated router and backup designated router are elected using OSPF multicasting capabilities point-to-multipoint— configures selected routers with neighbor/cost parameters, identifying a specific cost for the connection to the specified peer neighbors and multicast is not required. Routers on an interface becoming neighbors should match the network type all

- point-to-point—there are only two neighbors and multicast is not required. Routers on an interface becoming neighbors should match the network type all. (most common type) point-to-multipoint—directs the network to treats point-to-multipoint networks as a collective of point-to-point links. Point-to-Multipoint networks do not maintain a DR/BDR relationship. Point-to-Multipoint networks advertise a hot route for all the frame-relay endpoints.
- non-broadcast—use this type of network on networks having no broadcast/multicast capability, such as frame-relay, ATM, SMDS, & X.25. The key point is that these layer 2 protocols are unable to send broadcasts/multicasts

priority—a router with a high priority will always win the DR/BDR election process.
Priority Range is 0-255
Default is 1

retransmit-interval—configure the time between retransmitting lost link advertisements) Time in seconds between link state advertisement retransmissions for adjacencies belonging to the interface, The expected round-trip delay between any two routers in the attached network.
Range is 1–65535
Default is 5 second

transmit-delay—configure the transmit delay. The estimated time in seconds required to transmit a link state update packet on the interface.Link state advertisements in the update packet have their age incremented by this amount before transmission.
Range is 1–65535
Default is 1 seconds

policy route-policy—enable this policy route for this interface.

rip—enable split horizon to prevent a routing loop in your network. Basically, information about the routing for a particular packet is never sent back in the direction from which it was received.

Default is enabled

ipsec restrict | Restrict IPsec on this interface.

ipv6 [address *X:X:X:X::X/<2-128>* **eui-64] | [enable] | [firewall in | out | local** *<WORD>*] | **[nd dad attempts** *<0-600>* | **managed-config-flag-other-config-flag | prefix** *<X:X:X:X::X/<0-128> <0-4292967294>* | **infinite] | [ra dns server** *<X:X:X:X::X>* | **[hop-limit** *<1-255>* | **unspecified | interval** *<4-1800> <3-1350>*] | **[lifetime** *<0><4-9000>*] | **[suppress] | [reachable time** *<0-3600000>*] | **[retransmission-time** *<0-3600000>*] | **[router-preference high | low |medium] | [ospf [cost** *<1-65535>*] | **[dead-interval** *<1-65535>*] | **[hello-interval** *<1-65535>*] | **[ifmtu] | [instance-id** *<0-255>*] | **[mtu-ignore] | [network broadcast | point-to-point | [passive] | [priority** *<0-255>*] | **[retransmit-interval** *<1-65535>*] | **[transmit-delay** *<1-65535>*] | **[policy route-policy** *<WORD>*] | **[rip authentication key-chain | mode** *<WORD>*] **dns server** *<X:X:X:X::X>* | **[hop-limit** *<1-255>* | **unspecified | interval** *<4-1800> <3-1350>*] | **[lifetime** *<0><4-9000>*] | **[suppress] | [reachable time** *<0-3600000>*] | **[retransmission-time** *<0-3600000>*] | **[router-preference high | low |medium] | [ospf [cost** *<1-65535>*] | **[dead-interval** *<1-65535>*] | **[hello-interval** *<1-65535>*] | **[ifmtu] |[instance-id** *<0-255>*] | **[mtu-ignore] | [passive] | [priority** *<0-255>*] | **[retransmit-interval** *<1-65535>*] | **[transmit-delay** *<1-65535>*] | **[policy route-policy** *<WORD>*] | **[rip enable | split-horizon | disable poisoned-reverse]** |	Configure IPv6 parameters. **IPv6 address**—configure the IPv6 address eui-64. **enable**—enable IPv6 on this interface. **firewall**—set firewall for inbound, traffic destined for this router or outbound traffic. **nd**—IPv6 Interface Neighbor Discovery sub-commands. • dad (duplicate address detection) attempts—To check the uniqueness of an IPv6 address, a node sends Neighbor Solicitation messages. Use this command to specify the number of consecutive Neighbor Solicitation messages (dad_attempts) to be sent before this address can be configured Range 1–600 Default is 1 • managed config flags—specify whether hosts use the administrated protocol for address auto-configuration. Default is disabled (host uses stateless) • other-config-flags—specify whether hosts use the administrated protocol for non-address auto-configuration information. Default is disabled (hosts use stateless auto-sconfiguration of no-address information • prefix—specifies the IPv6 prefix advertised on the interface Configure the prefix length. Range is 0–128

ra—Router Advertisement Control

dns server—specify the name server in RA.

hop-limit—Specifies the Hop Count field of the IP header for outgoing (unicast) IP packets.
Range is 1–255
Default is 64

Interval—Specifies the advertisements. maximum/minimum time allowed between sending unsolicited multicast router advertisements.
Range of minimum is 3 to *0.75 max (dynamic range)
Default maximum 600 seconds, minimum is 0.33*max
Range is 1–1800 in seconds

lifetime—The lifetime associated with the default router in seconds. A value of 0 indicates that the router is not a default router and doesn't appear on the default router list.
Range is 1–9000 seconds
Default is 1800 seconds
0 = not a default route

suppress—enable or disable IPv6 Router advertisements.
Default is send router advertisements

reachable time—specifies the length in time (milliseconds) a node assumes a neighbor is reachable after receiving a reachability confirmation
Default is 0 (unspecified by this router)
Range is 0-360000 milliseconds

retransmission-time—The retransmission timer is used to control the time (in milliseconds) between retransmissions of neighbor solicitation messages from the user equipment (UE).
Range 1–3600000 in milliseconds
Default is 0

router-preference—set the default router preference. A High value means this router will be preferred.

- **High**
- **Medium**
- **Low**

Default is medium

OSPF—
cost—Configure a default metric to be applied to routes being distributed into OSPF.

dead-interval—Configure the interval during which at least one hello packet must be received from a neighbor before the router declares that neighbor as down (dead).

As with the hello interval, this value must be the same for all routers attached to a common network.

Default is 4 times the hello interval
Default is 40 seconds

hello interval—Configure the hello packet time interval for hello packets sent on an interface.
The default is 10 seconds.

– **ifmtu**—The range is dynamic (depending on the interface type) and it will match with the MTU value set on the interface.
instance-id—instance ID for this interface. Values are 0–255

mtu-ignore—By default, OSPF checks whether neighbors are using the same MTU on a common interface. Use this command

to disable this check and allow adjacencies when the MTU value differs between OSPF neighbors.

Network—

- broadcast–Specify OSPF broadcast multi-access network

- point-to-point–Specify OSPF point-to-point network

passive—no adjacency will be formed on this interface.

priority—A router with a high priority will always win the DR/BDR election process. Priority Range is 0-255
Default is 1

retransmit-interval—configure the time between retransmitting lost link advertisements) Time in seconds between link state advertisement retransmissions for adjacencies belonging to the interface, The expected round-trip delay between any two routers in the attached network.
Range is 1–65535
Default is 5 second

transmit-delay—configure the transmit delay. The estimated time in seconds required to transmit a link state update packet on the interface. Link state advertisements in the update packet have their age incremented by this amount before transmission.
Range is 1–65535
Default is 1 seconds

policy route-policy—enable this policy route for this interface.

rip—enable split horizon to prevent a routing loop in your network. Basically, information about the routing for a particular packet is never sent back in the direction from which it was received.
Default is enabled

logging event interface-ip | link-status |	Configure interface logging events and link status.
mac access-group *<WORD>* **deny | disable | permit |**	Configure mac access-group parameters for this interface.
mtu *<256-1500>* **|**	Sets maximum transmission unit (MTU)
ntp [broadcast client | destination *<A.B.C.D>***] | [key** *<1-65534>***] | [minpoll** *<4-17>***] | [version** *<1-4>***] | [disable] | [multicast [***<A.B.C.D>* | *<X:X:X:X::X>* **| client** *<A.B.C.D>* **|** *<X:X:X:X::X>***] | [key** *<1-65534>***] | [minpoll** *<4-17>***] | [version** *<1-4>***] |**	Network Time Protocol (NTP) is used distribute and maintain synchronization of time information between nodes in a network. The router can provide the time to NTP/SNTP capable client devices (or other Perle routers and IOAN's etc). You can run the SNTP client and the NTP server concurrently on your system. Therefore you can obtain time from an outside source and serve that time to the devices connected to the router. Configure Network Time Protocol (NTP) for this interface. **broadcast client**—listens to NTP broadcasts. **destination broadcast**—Configure broadcast destination address. **multicast** client—listens to NTP multicasts. **destination multicast**—multicast IPv4 or IPv6 address. **key**—Configure broadcast authentication key. **versions** 1 to 4 are support. **minimum poll interval** is 4(16s), 5(32 s), 6 (1m 4s), 7(2m,8s), 8(4m,16s), 9(8m, 32s), 10 (17,m, 4s), 11 (34,m,8s) Default is 6
role lan | trusted | wan |	Select the role for this interface. **LAN**—management access is from the LAN side **WAN**—management access is from the WAN side **Trusted**—management access from either the LAN or WAN side
service-policy in *<WORD>* **| out** *<WORD>***|**	Assigns traffic policy to this interface. Select whether the policy will apply to inbound or outbound traffic.

shutdown |	Shutdown this interface.
snmp trap interface-ip | link-status |	Configure SNMP traps for interface and link status
spanning-tree [bpdufilter enable | disable] | [bpduguard [disable | enable] | [cost *<1-200000000>*] | [guard loop | none | root | topology-change] | [link-type auto | point-to-point | shared] | mcheck | [mst cost *<1-200000000>*] | [port-priority *<0-240>*] | [portfast disable | edge | network] |	Configure interface parameters for spanning tree.

bpdufilter—don't send or receive BPDUs on this interface.
Default is Disabled

bpduguard—don't accept BPDUs on this interface.
Default is Disabled

cost—change port path cost.
Value is 1 to 200000000
Default is auto (defined by STP protocol)

- loop
- none
- root
- topology-change

link-type

- auto—this interface is point-to-point if configured for full duplex operation
- point-to-point
- shared

mcheck—force the mode from STP to RSTP/MSTP mode.

mst—change path cost and port priority for multiple spanning tree mode.

port-priority—change the port priority for an instance.
(increments of 16)
Default is 128

portfast network—this feature causes the router to enter the STP forwarding-state immediately or upon a linkup event, thus passing the listening and learning states. Some applications need to connect to the network immediately, else they will timeout.

portfast edge—is used to configure a port on which an end device is connected, such as a PC. All ports directly connected to end devices cannot create bridging loops in the network. |

	Therefore, the edge port directly transitions to the forwarding state, and skips the listening and learning stages.
	portfast disable—when enabled an interface will jump to the forwarding state of spanning-tree.
vrrp *<1-255>* |	This interface is part of VRRP group number.
zone-member security *<WORD>*}	This interface is a member of this zone security.
Command Modes	Perle(config-if-ssid)#

Usage Guidelines

Use this command to configure SSID sub menu commands.

Examples

This example restricts IPsec to this interface. All interfaces are used if no restrictions are in place.

Perle(config-if-ssid)# ipsec restrict

walled-garden domain *<WORD>* | **url** *hostname/* *<A.B.C.D>*}	Configure domains and URLs to allow access without authenticating first.
Command Modes	PerleRouter(config-hotspot)#

Usage Guidelines

Use this command to configure the Hotspot feature. Also knows as Captive Portal, it is a method of securing access to the Internet from within your wireless network. Users must enter authentication credentials before their wireless client devices can access the Internet.

Examples

This example sets session time for the users to 10 minutes. After no activity for 10 minutes, the user needs to re-authenticate with your router to gain access to the internet.

Perle(config-hotspot)#session-time 600

Use the no form of this command to negate a command or set to defaults.

Syntax Description	**(config-if-ethernet)#**
{alarm profile *<WORD>* |	Use this alarm profile for this interface.

arp disable-arp-filter | enable-arp-accept | enable-arp-announce | enable-arp-ignore | enable-proxy-arp | timeout *<1-2147483>* |	Configure ARP parameters. **Disable ARP filter**—If enabled the router responds to same ARP requests coming from multiple interfaces. **Enable ARP Accept**—Define behavior for gratuitous ARP frames who's IP is not already present in the ARP table: 0–don't create new entries in the ARP table 1–create new entries in the ARP table **Enable ARP Announce**—Define different restriction levels for announcing the local source IP address from IP packets in ARP requests sent on interface ● 0–(default) Use any local address, configured on any interface ● 1–Try to avoid local addresses that are not in the target's subnet for this interface
	Enable ARP Ignore—Define different restriction levels for announcing the local source IP address from IP packets in ARP requests sent on interface ● 0–(default) Use any local address, configured on any interface ● 1–Try to avoid local addresses that are not in the target's subnet for this interface **ARP Timeout**—If an ARP entry is not used for a specific amount of time the entry is removed from the caching table. **Enable Proxy ARP**—Enable Proxy ARP if you need your router to respond to local networks with its MAC address. Default is Disabled

authentication [host-mode | multi-auth | multi-host | single-host] | [periodic] | [port-control auto | forced-authorized | force-unauthorized] | [timer reauthenticate *<1-65535>* | restart *<1-65535>*] |

Selects authentication mode to use on this interface when using Dot1x devices.

Host Mode

Single host

- Only one device can authenticate and connect on the port

This is the default mode of operation.

Multiple host

- Unlimited number of devices can connect on the port once a single device has been authenticated on the port. This single device must be a data (as opposed to voice) device

Multiple authentication

- Each device connecting to your router is required to authenticate.
- No limit as to the number of devices which can authenticate on the port

periodic reauthentication—When enabled, the supplicant will be asked to re-authenticated based on the Advanced setting -> re-authentication timeout value.

Port control

- Auto—the port is locked expecting authentication from either a connected 802.1X client or if MAB is enabled, it will authenticate the MAC to the RADIUS server.

	• Force authorized—the port is unsecure/unlocked meaning normal operation where no 802.1X client or MAB authentication via RADIUS is required. This is the default setting. • Force unauthorized – the port is secured/locked and will NEVER allow any traffic to ingress into our Ethernet port/s. **Timer** **Maximum re-authentication retries**—Set the number of times the authenticator will attempt to re-authenticate a supplicant. Range is 1-10 seconds Default is 2 seconds **Restart timeout**— Interval in seconds after which an attempt should be made to authenticate an unauthorized port. If the parameter "server" is specified, the time is derived from the "Session-Timeout value" (RADIUS Attribute 27). Range is 1-65535 seconds Default is 60 seconds
bridge-group *<1-9999>* |	Adds this interface to the specified bridge-group.
description *<LINE>* |	Description for this interface.
dot1x [credential *<WORD>***]** | **[max-auth-req** *<1-10>***]** | **[max-req** *<1-10>***]** | **[pae authenticator | supplicant]** | **[supplicant eap profile** *<WORD>***]** | **[timeout quiet-**	Sets the Port Access Entity (PAE) type. **Supplicant**—The interface acts only as a supplicant and does not respond to messages that are meant for an authenticator.
period *<1-65535>* | **supp-period** *<1-65535>* | **tx-period** *<1-65535>***]** |	**Authenticator**—The interface acts only as an authenticator and does not respond to any messages meant for a supplicant. **Both**—The interface behaves both as a supplicant and as an authenticator and thus does respond to all dot1x messages.
duplex auto | half | full |	Select duplex for this interface. In most cases this parameter should be left at auto.

ip address [<*A.B.C.D*> <*A.B.C.D*> secondary | dhcp] | [ddns service dyndns | use-web skip <*WORD*> | url <*WORD*>] | [dhcp client class-id <*LINE*> | auto | client-id ethernet <*1-5*> | acsii <*WORD*> | auto | hex <*HEX-STRING* | hostname <*WORD*>] | [dhcp-relay] | [dns dhcp] | [firewall in | local | out <*WORD*>] | [health-profile <*WORD*> nexthop <*A.B.C.D*>] | [ospf authentication message-digest | null | authentication-key 0 <*WORD*> | 7 <*WORD*> | <*WORD*> | [cost <*1-65535*>] | [ead-interval <*1-65535*>] | [hello-interval <*1-65535*>] | [message-digest-key <*1-255*> md5 0 <*WORD*> | 7 <*WORD*> | <*WORD*>] | [mtu-ignore] | [network broadcast | non-broadcast | point-to-point | point-to-multipoint] | [priority <*0-255*>] | [retransmit-interval <*1-65535*>] | [transmit-delay <*1-65535*>] | [policy route-policy <*WORD*>] | [rip authentication key-chain <*WORD*> | mode md5 | text string 0 <*WORD*> | 7 <*WORD*> | <*WORD*> | split-horizon disable | poison-reverse] |

Configure IP parameters.

IP address/IP mask—Configure the IP address/mask of this interface.

secondary—add secondary or ip aliasing address for this interface.

Max secondary address-1-128

You must define a primary address before secondary IP addresses

Primary and secondary address can be on the same of different subnets of the primary address

DHCP—your address is assigned from a DHCP server.

DDNS—

Service—use dyndns login/password—configure the login id and password for the dnydns serve.r

Host/host-group—Hostname/list of hostnames registered with the DDNS service.

skip—skip everything before this ont he given URL.

Use-web URL—Enter the URL that you want to obtain an IP address from.
This allows the router to be seen on the Internet as a public address.

DHCP client —

Class ID:

- Auto
- Line

Specify a Hex string or ASCII text. This same hex string or text would be configured on the server side and associated with an address to give the client.

Client ID:
This can be configured to be the Ethernet interface number, ASCII text, Hex string or set to Auto.

option—60—Vendor class identifier<oem-name>:<model>:<serial#> in ASCII Router example: Perle:IRG5541:350-01T00003

Firewall—set firewall for inbound, traffic destined for this router or outbound traffic.

Hostname:
Specify a value for hostname option.

DHCP–relay—set DHCP-relay for this interface.

DNS dhcp—use DNS servers received from DHCP server for specified interface.

health-profile—use this health profile for this interface, configure a nexthop interface.

OSPF—authentication/authentication-key—enables message-digest authentication, text, or null. Authentication-key 0 | 7 <WORD>.

cost—Configure a default metric to be applied to routes being distributed into OSPF.
Range is 0 to 16777214
Default is none

dead-interval—Configure the interval during which at least one hello packet must be received from a neighbor before the router declares that neighbor as down (dead).) As with the hello interval, this value must be the same for all routers attached to a common network.

Default is 4 times the hello interval
Default is 40 seconds

hello interval—Configure the hello packet time interval for hello packets sent on an interface.
The default is 10 seconds.

message-digest-key—Configure a password used by neighboring routers for simple password authentication. It can be any continuous string of up to eight characters. There is no default value.

- None—no password
- Key-ID—Configure an authentication key
- md5—Identifies the key (password) used between this router and neighboring routers for MD5

authentication.

- 0-unencrypted key will follow
- specifies a hidden key will follow
- specifies a password (key) will follow (max 16 characters). The default is none

mtu-ignore—By default, OSPF checks whether neighbors are using the same MTU on a common interface. Use this command to disable this check and allow adjacencies when the MTU value differs between OSPF neighbors.

network—Configure the network type

- broadcast—a designated router and backup designated router are elected using OSPF multicasting capabilities point-to-multipoint— configures selected routers with neighbor/cost parameters, identifying a specific cost for the connection to the specified peer neighbors and multicast is not required. Routers on an interface becoming neighbors should match the network type all
- point-to-point—there are only two neighbors and multicast is not required. Routers on an interface becoming neighbors should match the network type all. (most common type)
- point-to-multipoint—directs the network to treats point-to-multipoint networks as a collective of point-to-point links. Point-to-Multipoint networks do not maintain a DR/BDR relationship. Point-to-Multipoint networks advertise a hot route for all the frame-relay endpoints.
- non-broadcast—use this type of network on networks having no broadcast/multicast capability, such as frame-relay, ATM, SMDS, & X.25. The key point is that these layer 2 protocols are unable to send broadcasts/multicasts

priority—a router with a high priority will always win the DR/BDR election process
Priority Range is 0-255
Default is 1

retransmit-interval—configure the time between retransmitting lost link advertisements) Time in seconds between link state advertisement retransmissions for adjacencies belonging to the interface, The expected round-trip delay between any two routers in the attached network. Range is 1–65535
Default is 5

transmit-delay—configure the transmit delay. The estimated time in seconds required to transmit a link state update packet on the interface.

Link state advertisements in the update packet have their age incremented by this amount before transmission
Range is 1–65535

policy route-policy—enable this policy route for this interface.

rip—enable split horizon to prevent a routing loop in your network. Basically, information about the routing for a particular packet is never sent back in the direction from which it was received.

Default is enabled

Default is 1 seconds

ipsec restrict │	Restrict IPsec on this interface.

ipv6 [address *<X:X:X:X::X/ <0-128>* **| autoconfig | dhcp] [enable] | [firewall in | out | local** *<WORD>***] | [nd dad attempt** *<0-500>* **| managed config-flag | other-config-flag | prefix** *<X:X:X:X::X/<0-128> <0-4294967294>* **| infinite | no- autoconfig | no-onlink] | [ra dns server** *<X:X:X:X::X>***] | [hop-limit** *<1-255>* **| unspecified] | [interval** *<4- 1800> <3-1350* **| [lifetime** *<0>* **| *<4-9000>***] | [suppress] | [reachable time** *<0-3600000>***] | [retransmission-time** *<0- 3600000>***] | [router-preference high | low |medium] | [ospf cost** *<1-65535>* **| dead-interval *<1-65535>* **| hello-interval** *<1- 65535>* **| ifmtu | instance-id *<0-255>* **| mtu-ignore | [network broadcast | point-to- point] | passive | priority** *<0- 255>* **| retransmit-interval** *<1- 65535>* **| transmit-delay** *<1- 65535>* **| [policy route-policy *<WORD>***] | [rip enable | split- horizon | disable poisoned- reverse]** |	Configure IPv6 parameters. **IPv6 address**—configure the IPv6 address eui-64, autoconfig, or dhcp. **enable**—enable IPv6 on this interface. **firewall**—set firewall for inbound, traffic destined for this router or outbound traffic. **nd**—IPv6 Interface Neighbor Discovery sub-commands. dad (duplicate address detection) attempts—To check the uniqueness of an IPv6 address, a node sends Neighbor Solicitation messages. Use this command to specify the number of consecutive Neighbor Solicitation messages (dad_attempts) to be sent before this address can be configured Range 1–600 Default is 1 - managed config flags—specify whether hosts use the administrated protocol for address auto-configuration. Default is disabled (host uses stateless) - other-config-flags—specify whether hosts use the administrated protocol for non- address auto-configuration information.

Default is disabled (hosts use stateless auto-configuration of no-address information

prefix—specifies the IPv6 prefix advertised on the interface

Configure the prefix length.
Range is 0–128

no-autoconfig—A prefix is onlink when it is assigned to an interface on a specified link. Enable or disable prefix for onlink determination.
Default is off

no-onlink—The sending router can indicate that a prefix is to be used for address autoconfiguration by setting the autonomous flag and specifying a nonzero Valid Lifetime value for the prefix.
Default is off

ra—Router Advertisement Control

dns server—specify the name server in RA.

hop-limit—Specifies the Hop Count field of the IP header for outgoing (unicast) IP packets.
Range is 1–255
Default is 64

interval—Specifies the maximum/minimum time allowed between sending unsolicited multicast router advertisements.
Range of minimum is 3 to *0.75 max (dynamic range)
Default maximum 600 seconds, minimum is 0.33*max
Range is 1–1800 in seconds

lifetime—The lifetime associated with the default router in seconds. A value of 0 indicates that the router is not a default router and doesn't appear on the default router list.
Range is 1–9000 seconds
Default is 1800 seconds
0 = not a default route

suppress—enable or disable IPv6 Router advertisements.
Default is send router advertisements

	reachable time—specifies the length in time (milliseconds) a node assumes a neighbor is reachable after receiving a reachability confirmation Default is 0 (unspecified by this router) Range is 0-360000 milliseconds
	router-preference—set the default router preference. A High value means this router will be preferred. • **High** • **Medium** • **Low** Default is medium **transmit-delay**—configure the transmit delay. The estimated time in seconds required to transmit a link state update packet on the interface. Link state advertisements in the update packet have their age incremented by this amount before transmission Range is 1–65535 Default is 1 seconds **policy route-policy**—enable this policy route for this interface. **rip**—enable split horizon to prevent a routing loop in your network. Basically, information about the routing for a particular packet is never sent back in the direction from which it was received Default is enabled
lldp max-neighbors *<1-50>* | **receive | tvl-select mac-phy-cfg | management-address | max-frame-size | port-description | system -capabilities | system-description | system-name | transmit** |	Configure LLDP parameters.
logging event interface-ip | link-status |	Configure logging events for interface and link status.
mab eap |	Sets MAC authentication bypass interface commands.
mac access-group <word> deny | disable | permit |	Sets interface MAC access-list parameters.

mtu *<64-9000>* |	Sets maximum transmission unit (MTU). Values are 64 t 9000 bytes Default is 1500 bytes
ntp [broadcast client | **destination** *<A.B.C.D>***] | [key** *<1-65534>***] | [minpoll** *<4-17>***]** **| [version** *<1-4>***] | [disable] |** **[multicast [***<A.B.C.D>* **|** *<X:X:X:X::X>* **| client** *<A.B.C.D>* **|** *<X:X:X:X::X>***] |** **[key** *<1-65534>***] | [minpoll** *<4-* *17>***] | [version** *<1-4>***] |**	Network Time Protocol (NTP) is used distribute and maintain synchronization of time information between nodes in a network. The router can provide the time to NTP/ SNTP capable client devices (or other Perle routers and IOLAN's etc). You can run the SNTP client and the NTP server concurrently on your system. Therefore you can obtain time from an outside source and serve that time to the devices connected to the router. Configure Network Time Protocol (NTP) for this interface. **broadcast client**—listens to NTP broadcasts. **destination broadcast**—Configure broadcast destination address. **multicast** client—listens to NTP multicasts. **destination multicast**—multicast IPv4 or IPv6 address. **key**—Configure broadcast authentication key. **versions** 1 to 4 are support. **minimum poll interval** is 4(16s), 5(32 s), 6 (1m 4s), 7(2m,8s), 8(4m,16s), 9(8m, 32s), 10 (17,m, 4s), 11 (34,m,8s) Default is 6
power efficient-ethernet auto |	Configure interface power settings.
role lan |trusted | wan |	Select the role for this interface. **LAN—** management access is from the LAN side **WAN—**management access is from the WAN side **Trusted—**management access from either the LAN or WAN side
service-policy in | out |	Assigns traffic policy to this interface. Select whether the policy will apply to inbound or outbound traffic.
shutdown |	Shutdown this interface.

snmp trap interface-ip | link-status |	Configure SNMP traps for interface and link status.
spanning-tree [bpdufilter enable | disable] | [bpduguard [disable | enable] | [cost <1-200000000>] | | [guard loop | none | root | topology-change] | [link-type auto | point-to-point | shared] |mcheck | [mst cost <1-200000000> | [port-priority <0-240>] | | [portfast disable | edge | network] |	Configure interface parameters for spanning tree. **bpdufilter**—don't send or receive BPDUs on this interface. Default is Disabled **bpduguard**—don't accept BPDUs on this interface. Default is Disabled **cost**—change port path cost. Value is 1 to 200000000 Default is auto (defined by STP protocol) ● loop ● none ● root ● topology-change **link-type** ● auto—this interface is point-to-point if configured for full duplex operation ● point-to-point ● shared **mcheck**—force the mode from STP to RSTP/MSTP mode. **mst**—change path cost and port priority for multiple spanning tree mode. **port-priority**—change the port priority for an instance. (increments of 16) Default is 128 **portfast network**—this feature causes the router to enter the STP forwarding-state immediately or upon a linkup event, thus passing the listening and learning states. Some applications need to connect to the network immediately, else they will timeout. **portfast edge**—is used to configure a port on which an end device is connected, such as a PC. All ports directly connected to end devices cannot create bridging loops in the network.

	Therefore, the edge port directly transitions to the forwarding state, and skips the listening and learning stages. **portfast disable**—when enabled an interface will jump to the forwarding state of spanning-tree.
speed 10 |100 | 1000 |auto |	Configure the Ethernet speed.. ● 10 ● 100 ● 100010 ● 100 ● 1000 ● auto
vrrp *<1-255>* |	This interface is part of VRRP group number.
zone-member security *<WORD>*}	This interface is a member of zone security.
Command Modes	Perle(config-if)#

Usage Guidelines

Set up Ethernet parameters for this interface.

Examples

This example sets the speed for this interface to 1000.
Perle(config-if)#speed 1000

Syntax Description	(config-subif)#

{**arp disable-arp-filter** | **enable-arp-accept** | **enable-arp-announce** | **enable-arp-ignore** | **enable-proxy-arp** | **timeout** *<1-2147483>* |	Configure ARP parameters. **Disable ARP filter**—If enabled the router responds to same ARP requests coming from multiple interfaces.
	Enable ARP Accept—Define behavior for gratuitous ARP frames who's IP is not already present in the ARP table: 0—don't create new entries in the ARP table 1—create new entries in the ARP table **Enable ARP Announce**—Define different restriction levels for announcing the local source IP address from IP packets in ARP requests sent on interface • 0—(default) Use any local address, configured on any interface • 1—Try to avoid local addresses that are not in the target's subnet for this interface **Enable ARP Ignore**—Define different restriction levels for announcing the local source IP address from IP packets in ARP requests sent on interface • 0—(default) Use any local address, configured on any interface • 1—Try to avoid local addresses that are not in the target's subnet for this interface **ARP Timeout**—If an ARP entry is not used for a specific amount of time the entry is removed from the caching table. **Enable Proxy ARP**—Enable Proxy ARP if you need your router to respond to local networks with its MAC address. Default is Disabled
bridge-group *<1-9999>* |	Add this interface to the specified bridge group.
description |	Configure sub-interface description.

ip [address *<A.B.C.D> < A.B.C.D>* **| dhcp] | [dhcp client class-id** *<LINE>* **| auto | client-id ethernet** *<1-5>* **| acsii** *<WORD>* **| auto | hex** *<HEX-STRING* **| hostname** *<WORD>***] | [dhcp-relay] | [firewall in | local | out** *<WORD>***] | [health-profile** *<WORD>* **nexthop** *<A.B.C.D>***] | [ospf authentication message-digest | null | authentication-key 0** *<WORD>* **| 7** *<WORD>* **|** *<WORD>* **| [cost** *<1-65535>***] | [dead-interval** *<1-65535>***] | [hello-interval** *<1-65535>***] | [message-digest-key** *<1-255>* **md5 0** *<WORD>* **| 7** *<WORD>* **|** *<WORD>***] | [mtu-ignore] | [network broadcast | non-broadcast | point-to-point | point-to-multipoint] | [policy route-policy** *<WORD>***] | [rip authentication key-chain** *<WORD>* **| mode md5| text string 0** *<WORD>* **| 7** *<WORD>* **|** *<WORD>***| split-horizon disable | poison-reverse] |**

Configure IP parameters.

IP address/IP mask—Configure the IP address/mask of this interface

secondary—add secondary or ip aliasing address for this interface

DHCP—your address is assigned from a DHCP server

DHCP client —

Class ID:

- Auto
- Line

Specify a Hex string or ASCII text. This same hex string or text would be configured on the server side and associated with an address to give the client.

Client ID:
This can be configured to be the Ethernet interface number, ASCII text, Hex string or set to Auto.

option—60—Vendor class identifier<oem-name>:<model>:<serial#> in ASCII
Router example: Perle:IRG5541:350-01T00003

Hostname:
Specify a value for hostname option

DHCP–relay—set DHCP-relay for this interface.

Firewall—set firewall for inbound, traffic destined for this router or outbound traffic

health-profile—use this health profile for this interface, configure a nexthop interface

OSPF—

authentication/authentication-key—enables message-digest authentication, text, or null. Authentication-key 0 | 7 <WORD>

cost—Configure a default metric to be applied to routes being distributed into OSPF. Range is 0 to 16777214
Default is none

dead-interval—Configure the interval during which at least one hello packet must be received from a neighbor before the router declares that neighbor as down (dead).

As with the hello interval, this value must be the same for all routers attached to a common network

Default is 4 times the hello interval
Default is 40 seconds

hello interval—Configure the hello packet time interval for hello packets sent on an interface.
The default is 10 seconds.

message-digest-key—Configure a password used by neighboring routers for simple password authentication. It can be any continuous string of up to eight characters. There is no default value.

- None—no password
- Key-ID—Configure an authentication key

md5—Identifies the key (password) used between this router and neighboring routers for MD5 authentication.

- 0-unencrypted key will follow
- specifies a hidden key will follow
- specifies a password (key) will follow (max 16 characters).
  The default is none

mtu-ignore—By default, OSPF checks whether neighbors are using the same MTU on a common interface. Use this command to disable this check and allow adjacencies when the MTU value differs between OSPF neighbors.

network—

- broadcast—a designated router and backup designated router are elected using OSPF multicasting capabilities point-to-multipoint— configures selected routers with neighbor/cost parameters, identifying a specific cost for the connection to the specified peer neighbors and multicast is not required. Routers on an interface becoming neighbors should match the network type all
- point-to-point—there are only two neighbors and multicast is not required. Routers on an interface becoming neighbors should match the network type all. (most common type)
- point-to-multipoint—directs the network to treats point-to-multipoint networks as a collective of point-to-point links. Point-to-Multipoint networks do not maintain a DR/BDR relationship. Point-to-Multipoint networks advertise a hot route for all the frame-relay endpoints send broadcasts/multicasts

- non-broadcast—use this type of network on networks having no broadcast/multicast capability, such as frame-relay, ATM, SMDS, & X.25. The key point is that these layer 2 protocols are unable to send broadcasts/multicasts

priority—a router with a high priority will always win the DR/BDR election process
Priority Range is 0-255
Default is 1

retransmission-time—The retransmission timer is used to control the time (in milliseconds) between retransmissions of neighbor solicitation messages from the user equipment (UE).
Range 1–3600000 in milliseconds
Default is 0

router-preference—set the default router preference. A High value means this router will be preferred.

- **High**
- **Medium**
- **Low**

Default is medium

transmit-delay—configure the transmit delay. The estimated time in seconds required to transmit a link state update packet on the interface. Link state advertisements in the update packet have their age incremented by this amount before transmission
Range is 1–65535
Default is 1 seconds

policy route-policy—enable this policy route for this interface.

rip—enable split horizon to prevent a routing loop in your network. Basically, information about the routing for a particular packet is never sent back in the direction from which it was received.Default is enabled

ipsec restrict |	Restrict IPv6 on this interface.

ipv6 [address *<X:X:X:X::X/ <0-128>* **| autoconfig | dhcp] [enable] | [firewall in | out | local** *<WORD>***] | [nd dad attempt** *<0-500>* **| managed config-flag | other-config-flag | prefix** *<X:X:X:X::X/<0-128> <0-4294967294>* **| infinite | [ra dns server** *<X:X:X:X::X>***] | [hop-limit** *<1-255>* **| unspecified] | [interval** *<4- 1800> <3-1350>***] | [lifetime** *<0>* **|** *<4-9000>***] | [suppress] | [reachable time** *<0-3600000>***] | [retransmission-time** *<0- 3600000>***] | [router-preference high | low | medium] | [ospf [cost** *<1-65535>***] | [dead- interval** *<1-65535>***] | [hello- interval** *<1-65535>***] | [ifmtu] |**

Configure IPv6 parameters.

IPvV6 address or DHCP—configure the IPv6 address and prefix length or obtain an IPv6 address using DHCP

enable—enable IPv6 on this interface

firewall—set firewall for inbound, traffic destined for this router or outbound traffic

nd—IPv6 Interface Neighbor Discovery sub-commands

- dad (duplicate address detection) attempts—To check the uniqueness of an IPv6 address, a node sends Neighbor Solicitation messages. Use this command to specify the number of consecutive Neighbor Solicitation messages (dad_attempts) to be sent before this address can be configured. before this address can be configured. Range 1–600
  Default is 1

[instance-id *<0-255>*] | [mtu-ignore] | [network broadcast | point-to-point] | [passive] | [priority *<0-255>*] | [retransmit-interval *<1-65535>*] | [transmit-delay *<1-65535>*] | [policy route-policy *<WORD>*] | [rip enable | split-horizon disable | poisoned-reverse] |

- managed config flags—specify whether hosts use the administrated protocol for address auto-configuration. Default is disabled (host uses stateless)

- other-config-flags—specify whether hosts use the administrated protocol for non-address auto-configuration information.
Default is disabled (hosts use stateless auto-configuration of no-address information

- prefix—specifies the IPv6 prefix advertised on the interface Configure the prefix length.
Range is 0–128

no-autoconfig—A prefix is onlink when it is assigned to an interface on a specified link. Enable or disable prefix for onlink determination.
Default is off

no-onlink—The sending router can indicate that a prefix is to be used for address autoconfiguration by setting the autonomous flag and specifying a nonzero Valid Lifetime value for the prefix.
Default is off

ra—Router Advertisement Control

dns server—specify the name server in RA.

hop-limit—Specifies the Hop Count field of the IP header for outgoing (unicast) IP packets.
Range is 1–255
Default is 64

interval—Specifies the maximum/minimum time allowed between sending unsolicited multicast router advertisements.
Range of minimum is 3 to *0.75 max (dynamic range)
Default maximum 600 seconds, minimum is 0.33*max
Range is 1–1800 in seconds

lifetime—The lifetime associated with the default router in seconds. A value of 0 indicates that the router is not a default router and doesn't appear on the default router list.
Range is 1–9000 seconds
Default is 1800 seconds
0 = not a default route

suppress—enable or disable IPv6 Router advertisements.
Default is send router advertisements
reachable time—specifies the length in time (milliseconds) a node assumes a neighbor is reachable after receiving a reachability confirmation
Default is 0 (unspecified by this router)
Range is 0-360000 milliseconds

retransmission-time—The retransmission timer is used to control the time (in milliseconds) between retransmissions of neighbor solicitation messages from the user equipment (UE).
Range 1–3600000 in milliseconds
Default is 0

router-preference—set the default router preference. A High value means this router will be preferred.

- **High**
- **Medium**
- **Low**

Default is medium

OSPF—
cost—Configure a default metric to be applied to routes being distributed into OSPF.
Range is 0–16777214

dead-interval—Configure the interval during which at least one hello packet must be received from a neighbor before the router declares that neighbor as down (dead).) As with the hello interval, this value must be the same for all routers attached to a common network.
Default is 4 times the hello interval
Default is 40 seconds

hello interval—Configure the hello packet time interval for hello packets sent on an interface.
Default is none
The default is 10 second

ifmtu—The range is dynamic (depending on the interface type) and it will match with the MTU value set on the interface.
instance-id—instance ID for this interface
Values are 0–255

mtu-ignore—By default, OSPF checks whether neighbors are using the same MTU on a common interface. Use this command to disable this check and allow adjacencies when the MTU value differs between OSPF neighbors.

Network—

- broadcast–Specify OSPF broadcast multi-access network

- point-to-point–Specify OSPF point-to point network

passive—no adjacency will be formed on this interface

priority—a router with a high priority will always win the DR/BDR election process
Priority Range is 0-255
Default is 1

retransmit-interval—configure the time between retransmitting lost link advertisements) Time in seconds between link state advertisement retransmissions for adjacencies belonging to the interface,

The expected round-trip delay between any two routers in the attached network.
Range is 1–65535
Default is 5 second

transmit-delay—configure the transmit delay. The estimated time in seconds required to transmit a link state update packet on the interface. Link state advertisements in the update packet have their age incremented by this amount before transmission
Range is 1–65535
Default is 1 seconds

policy route-policy—enable this policy route for this interface.

	rip—enable split horizon to prevent a routing loop in your network. Basically, information about the routing for a particular packet is never sent back in the direction from which it was received
	Default is enabled
logging event interface-ip | **link-status** |	Configure logging events for interface and link status.
mtu *<64-9000>* |	Configure Maximum Transmission Unit (MTU).
	Values are 64-9000 bytes Default is 1500 bytes
ntp [broadcast client | **destination** *<A.B.C.D>***]** | **[key** *<1-65534>***]** | **[minpoll** *<4-17>***]** | **[version** *<1-4>***]** | **[disable]** | **[multicast [**<*A.B.C.D*> | *<X:X:X:X::X>* | **client** *<A.B.C.D>* | *<X:X:X:X::X>***]** | **[key** *<1-65534>***]** | **[minpoll** *<4-17>***]** | **[version** *<1-4>***]** |	Network Time Protocol (NTP) is used distribute and maintain synchronization of time information between nodes in a network The router can provide the time to NTP/SNTP capable client devices (or other Perle routers and IOLAN's etc). You can run the SNTP client and the NTP server concurrently on your system. Therefore you can obtain time from an outside source and serve that time to the devices connected to the router.
	Configure Network Time Protocol (NTP) for this interface.
	broadcast client—listens to NTP broadcasts
	destination broadcast—Configure broadcast destination address
	multicast client—listens to NTP multicasts
	destination multicast—multicast IPv4 or IPv6 address
	key—Configure broadcast authentication key
	versions—1 to 4 are support.
	minimum poll interval is 4(16s), 5(32 s), 6 (1m 4s), 7(2m,8s), 8(4m,16s), 9(8m, 32s), 10 (17,m, 4s), 11 (34,m,8s) Default is 6
role lan | **trusted** | **wan** |	Select the role for this interface.
	LAN—management access is from the LAN side
	WAN—management access is from the WAN side
	Trusted—management access from either the LAN or WAN side

service-policy in | out |	Assign traffic policy to this interface. Select whether the policy will apply to inbound or outbound traffic.
shutdown |	Shut down this interface.
snmp trap interface-ip | link-status |	Set SNMP traps for interface and link status.

spanning-tree [bpdufilter enable | disable] | [bpduguard [disable | enable] | [cost <1-200000000>] | [guard loop | none | root | topology-change] | link-type aut | point-to-point | shared] | mcheck | [mst cost <1-200000000> | port-priority <0-240> | [portfast disable | edge | network] |	Set interface parameters for spanning tree. **bpdufilter**—don't send or receive BPDUs on this interface. Default is Disabled **bpduguard**—don't accept BPDUs on this interface. Default is Disabled **cost**—change port path cost. Value is 1 to 200000000. Default is auto (defined by STP protocol) **guard** ● loop ● none ● root ● topology-change **link-type** ● auto—this interface is point-to-point if configured for full duplex operation ● point-to-point ● shared **mcheck**—force the mode from STP to RSTP/MSTP mode **mst**—change path cost and port priority for multiple spanning tree mode **port-priority**—change the port priority for an instance. (increments of 16) Default is 128 **portfast network**—this feature causes the router to enter the STP forwarding-state immediately or upon a linkup event, thus passing the listening and learning states. Some applications need to connect to the network immediately, else they will timeout. **portfast edge**—is used to configure a port on which an end device is connected, such as a PC. All ports directly connected to end devices cannot create bridging loops in the network. Therefore, the edge port directly transitions to the forwarding state, and skips the listening and learning stages.
	Portfast disable—when enabled an interface will jump to the forwarding state of spanning-tree.

vrrp *<1-255>* │	This interface is part of VRRP group number.
zone-member security *<WORD>*}	Set interface to be a member of this security zone.

Command Modes	Perle(config)#interface ethernet 1.100 Perle(config-subif)#

Usage Guidelines

Set a sub interface within an Ethernet interface.

Examples

This example sets a sub interface of 100 on Ethernet 1interface.

Perle(config)# interface ethernet 1.100

Syntax Description	(config-if-range)#
{**alarm profile** *<WORD>*		Use this alarm profile for this interface.

arp disable-arp-filter | enable-arp-accept | enable-arp-announce | enable-arp-ignore | enable proxy-arp | timeout *<1-2147483>* |	Configure ARP parameters.
	Disable ARP filter—If enabled the router responds to same ARP requests coming from multiple interfaces.
	Enable ARP Accept—Define behavior for gratuitous ARP frames who's IP is not already present in the ARP table: 0—don't create new entries in the ARP table 1—create new entries in the ARP table
	Enable ARP Announce—Define different restriction levels for announcing the local source IP address from IP packets in ARP requests sent on interface
	• 0—(default) Use any local address, configured on any interface
	• 1—Try to avoid local addresses that are not in the target's subnet for this interface
	Enable ARP Ignore—Define different restriction levels for announcing the local source IP address from IP packets in ARP requests sent on interface
	• 0—(default) Use any local address, configured on any interface
	• 1—Try to avoid local addresses that are not in the target's subnet for this interface
	ARP Timeout—If an ARP entry is not used for a specific amount of time the entry is removed from the caching table.
	Enable Proxy ARP—Enable Proxy ARP if you need your router to respond to local networks with its MAC address. Default is Disabled
authentication host-mode | multi-auth | multi-host | single-host | periodic | port-control auto | forced-authorized | force-unauthorized | timer reauthenticate *<1-65535>* | restart *<1-65535>* |	Configure authentication parameters to use on this interface when using Dot1x devices.
	Selects authentication mode to use on this interface when using Dot1x devices.
	Host Mode
	Single host
	• Only one device can authenticate and connect on the port.
	• This is the default mode of operation.

Multiple host

- Unlimited number of devices can connect on the port once a single device has been authenticated on the port. This single device must be a data (as opposed to voice) device.

Multiple authentication

- Each device connecting to your router is required to authenticate.
- No limit as to the number of devices which can authenticate on the port.

Multiple authentication

- Each device connecting to your router is required to authenticate.
- No limit as to the number of devices which can authenticate on the port.

Port control

- Auto—the port is locked expecting authentication from either a connected 802.1X client or if MAB is enabled, it will authenticate the MAC to the RADIUS server.
- Force authorized—the port is unsecure/ unlocked meaning normal operation where no 802.1X client or MAB authentication via RADIUS is required. This is the default setting.
- Force unauthorized – the port is secured/ locked and will NEVER allow any traffic to ingress into our Ethernet port/s.

Timer

Maximum re-authentication retries—
Set the number of times the authenticator will attempt to re-authenticate a supplicant.
Range is 1-10 seconds
Default is 2 seconds

Restart timeout—
Interval in seconds after which an attempt should be made to authenticate an unauthorized port. If the parameter "server" is specified, the time is derived from the "Session-Timeout value" (RADIUS Attribute 27)
Range is 1-65535 seconds
Default is 60 seconds

bridge-group *<1-9999>*		Add this interface to the specified bridge-group.

description *<LINE>* |	Add this interface to the specified bridge-group.
dot1x [credential *<WORD>*\] | **[max-auth-req** *<1-10>*\] | **[max-req** *<1-10>*\] | **[pae authenticator | supplicant]** | **[supplicant eap profile** *<WORD>*\] | **[timeout quiet-period** *<1-65535>* | **supp-period** *<1-65535>* | **tx-period** *<1-65535>*\] |	Sets the Port Access Entity (PAE) type. **Supplicant**—The interface acts only as a supplicant and does not respond to messages that are meant for an authenticator. **Authenticator**—The interface acts only as an authenticator and does not respond to any messages meant for a supplicant. **Both**—The interface behaves both as a supplicant and as an authenticator and thus does respond to all dot1x messages
duplex auto | half | full |	Select duplex for this interface. In most cases this parameter should be left at auto
ip [address *<A.B.C.D>* | **dhcp]** | **[ddns service dyndns | use-web skip** *<WORD>* | **url** *<WORD>*\] | **[dhcp client class-id** *<LINE>* | **auto | client-id ethernet** *<1-5>* | **acsii** *<WORD>* | **auto | hex** *<HEX-STRING* | **hostname** *<WORD>*\] | **[dhcp-relay]** | **[firewall in | local | out** *<WORD>*\] | **[health-profile** *<WORD>* **nexthop** *<A.B.C.D>* | **dhcp]** | **[ospf authentication [message-digest | null | authentication-key** *<LINE>*\] | **[cost** *<1-65535>* | **dead-interval** *<1-65535>* | **hello-interval** *<1-65535>* | **message-digest-key** *<1-255>* **md5** *<LINE>*\] | **[mtu-ignore]** | **[network broadcast | non-broadcast | point-to-point | point-to-multipoint]** | **[priority** *<0-255>*\] | **[retransmit-interval** *<1-65535>*\] | **[transmit-delay** *<1-65535>*\] | **[policy route-policy** *<WORD>*\] | **[rip authentication key-chain** *<WORD>* | **mode md5 | text string** *<0 | 7 | WORD>* | **split-horizon disable | poisoned-reverse]** |	Configure IP parameters. **IP address/IP mask**—Configure the IP address/mask of this interface **secondary**—add secondary addresses (IP aliasing) to this interface **DHCP**—your address is assigned from a DHCP server **DHCP client —** **DNS dhcp**—use DNS servers received from DHCP server for specified interface **Firewall**—set firewall for inbound, traffic destined for this router or outbound traffic **health-profile**—use this health profile for this interface, configure a nexthop interface. **OSPF—** **authentication/authentication-key—** enables message-digest authentication, text, or null. Authentication-key 0 | 7 <WORD> **cost**—Configure a default metric to be applied to routes being distributed into OSPF. Range is 0 to 16777214 Default is none **dead-interval**—Configure the interval during which at least one hello packet must be received from a neighbor before the router declares that neighbor as down (dead).

hello interval—Configure the hello packet time interval for hello packets sent on an interface.
The default is 10 seconds.

message-digest-key—Configure a password used by neighboring routers for simple password authentication. It can be any continuous string of up to eight characters. There is no default value.

- None—no password
- Key-ID—Configure an authentication key
- md5—Identifies the key (password) used between this router and neighboring routers for MD5 authentication.
  - 0-unencrypted key will follow
  - specifies a hidden key will follow
  - specifies a password (key) will follow (max 16 characters).
    The default is none

mtu-ignore—By default, OSPF checks whether neighbors are using the same MTU on a common interface. Use this command to disable this check and allow adjacencies when the MTU value differs between OSPF neighbors.

network—Configure the network type

- broadcast—a designated router and backup designated router are elected using OSPF multicasting capabilities point-to-multipoint— configures selected routers with neighbor/cost parameters, identifying a specific cost for the connection to the specified peer neighbors and multicast is not required. Routers on an interface becoming neighbors should match the network type all
- point-to-point—there are only two neighbors and multicast is not required. Routers on an interface becoming neighbors should match the network type all. (most common type)
- point-to-multipoint—directs the network to treats point-to-multipoint networks as a collective of point-to-point links. Point-to-Multipoint networks do not maintain a DR/BDR relationship.

- Point-to-Multipoint networks advertise a hot route for all the frame-relay endpoints.multicast capability, such as frame-relay, ATM, SMDS, & X.25. The key point is that these layer 2 protocols are unable to send broadcasts/multicasts
- non-broadcast—use this type of network on networks having no broadcast/

priority—a router with a high priority will always win the DR/BDR election process
Priority Range is 0-255
Default is 1

retransmit-interval—configure the time between retransmitting lost link advertisements) Time in seconds between link state advertisement retransmissions for adjacencies belonging to the interface,
The expected round-trip delay between any two routers in the attached network.
Range is 1–65535
Default is 5 second

transmit-delay—configure the transmit delay. The estimated time in seconds required to transmit a link state update packet on the interface.

Link state advertisements in the update packet have their age incremented by this amount before transmission.
Default is enabled
Range is 1–65535
Default is 1 seconds

policy route-policy—enable this policy route for this interface.

rip—enable split horizon to prevent a routing loop in your network. Basically, information about the routing for a particular packet is never sent back in the direction from which it was received.
Link state advertisements in the update packet have their age incremented by this amount before transmission.
Default is enabled
Range is 1–65535
Default is 1 seconds

ipsec restrict		Restrict IPsec on this interface.

ipv6 address *<X:X:X:X::X/<0-128>* | **autoconfig** | **dhcp]** **[enable]** | **[firewall in** | **out** | **local** *<WORD>*] | **[nd dad attempt** *<0-500>* | **managed config-flag** | **other-config-flag** | **prefix** *<X:X:X:X::X/<0-128> <0-4294967294>* | **infinite** | **no-autoconfig** | **no-onlink]** | **[ra dns server** *<X:X:X:X::X>* | **[hop-limit** *<1-255>* | **unspecified]** | **[interval** *<4-1800> <3-1350>*] | **[lifetime** *<0>* | *<4-9000>*] | **[suppress]** | **[reachable time** *<0-3600000>*] | **retransmission-time** *<0-3600000>* | **router-preference high** | **low** |**medium]** | **[ospf [cost** *<1-65535>*] | **[dead-interval** *<1-65535>*] | **[hello-interval** *<1-65535>*] | **[ifmtu]** | **[instance-id** *<0-255>*] | **[mtu-ignore]** | **[network broadcast** | **point-to-point]** | **[passive** | **priority** *<0-255>*] | **[retransmit-interval** *<1-65535>*] | **[transmit-delay** *<1-65535>*] | **[policy route-policy** *<WORD>*] | **[rip** | **split-horizon disable** | **poisoned-reverse]**	Configure IPv6 parameters.

\|**IPvV6 address or DHCP**—configure the IPv6 address and prefix length or obtain an IPv6 address using DHCP

enable—enable IPv6 on this interface

firewall—set firewall for inbound, traffic destined for this router or outbound traffic

nd—IPv6 Interface Neighbor Discovery sub-commands

- dad (duplicate address detection) attempts—To check the uniqueness of an IPv6 address, a node sends Neighbor Solicitation messages. Use this command to specify the number of consecutive Neighbor Solicitation messages (dad_attempts) to be sent before this address can be configured.
Range 1–600
Default is 1

- managed config flags—specify whether hosts use the administrated protocol for address auto-configuration. Default is disabled (host uses stateless)

- other-config-flags—specify whether hosts use the administrated protocol for non-address auto-configuration information.
Default is disabled (hosts use stateless auto-configuration of no-address information

- prefix—specifies the IPv6 prefix advertised on the interface Configure the prefix length.
Range is 0–128 |

policy *<WORD>***]** | **[rip authentication key-chain | mode** *<WORD>***]** |	**no-autoconfig**—A prefix is onlink when it is assigned to an interface on a specified link. Enable or disable prefix for onlink determination. Default is off **no-onlink—**The sending router can indicate that a prefix is to be used for address autoconfiguration by setting the autonomous flag and specifying a nonzero Valid Lifetime value for the prefix. Default is off **ra**—Router Advertisement Control **dns server**—specify the name server in RA. **hop-limit**—Specifies the Hop Count field of the IP header for outgoing (unicast) IP packets. Range is 1–255 Default is 64 **Interval**—Specifies the maximum/minimum time allowed between sending unsolicited multicast router advertisements. Range of minimum is 3 to *0.75 max (dynamic range) Default maximum 600 seconds, minimum is 0.33*max Range is 1–1800 in seconds **lifetime**—The lifetime associated with the default router in seconds. A value of 0 indicates that the router is not a default router and doesn't appear on the default router list. The router lifetime applies only to the router's usefulness as a default router; it does not apply to information contained in other message fields or options. Range is 1–9000 seconds Default is 1800 seconds 0 = not a default route **suppress**—enable or disable IPv6 Router advertisements. Default is send router advertisements **reachable time**—specifies the length in time (milliseconds) a node assumes a neighbor is reachable after receiving a reachability confirmation Default is 0 (unspecified by this router) Range is 0-360000 milliseconds

retransmission-time—The retransmission timer is used to control the time (in milliseconds) between retransmissions of neighbor solicitation messages from the user equipment (UE).
Range 1–3600000 in milliseconds
Default is 0

router-preference—set the default router preference. A Hgh value means this router will be preferred.

- **High**
- **Medium**
- **Low**

Default is medium

OSPF—

authentication/authentication-key— enables message-digest authentication, text, or null. Authentication-key 0 | 7 <WORD>

cost—Configure a default metric to be applied to routes being distributed into OSPF.
Range is 0 to 16777214
Default is none

dead-interval—Configure the interval during which at least one hello packet must be received from a neighbor before the router declares that neighbor as down (dead).

hello interval—Configure the hello packet time interval for hello packets sent on an interface.
The default is 10 seconds.

mtu-ignore—By default, OSPF checks whether neighbors are using the same MTU on a common interface. Use this command to disable this check and allow adjacencies when the MTU value differs between OSPF neighbors.

network—

- broadcast–Specify OSPF broadcast multi-access network

- point-to-point–Specify OSPF point-to-point network

	priority—a router with a high priority will always win the DR/BDR election process Priority Range is 0-255 Default is 1
	Range is 1–65535 Default is 5 second
	Default is enabled Range is 1–65535 Default is 1 seconds
	retransmit-interval—configure the time between retransmitting lost link advertisements) Time in seconds between link state advertisement retransmissions for adjacencies belonging to the interface, The expected round-trip delay between any two routers in the attached network. **transmit-delay**—configure the transmit delay. The estimated time in seconds required to transmit a link state update packet on the interface.
	Link state advertisements in the update packet have their age incremented by this amount before transmission. **policy route-policy**—enable this policy route for this interface.
	rip—enable split horizon to prevent a routing loop in your network. Basically, information about the routing for a particular packet is never sent back in the direction from which it was received.
	Default is enabled
lldp max-neighbors *<1-50>* | **receive** | **tvl-select mac-phy-cfg** | **management-address** | **max-frame-size** | **port-description** | **system -capabilities** | **system-description** | **system-name** | **transmit** |	Configure LLDP parameters.
logging event interface-ip | **link-status** |	Configure logging events for interface and link status.
mab eap |	Sets MAC authentication bypass interface commands.
mtu *<64-9000>* |	Configure maximum transmission unit (MTU). Values are 64-9000 Default is

ntp [broadcast client | **destination** *<A.B.C.D>*] | [key *<1-65534>*] | [minpoll *<4-17>*] | [version *<1-4>*] | [disable] | [multicast [*<A.B.C.D>* | *<X:X:X:X::X>* | client	Network Time Protocol (NTP) is used distribute and maintain synchronization of time information between nodes in a network. The router can provide the time to NTP/SNTP capable client devices (or other Perle routers and IOLAN's etc)
<A.B.C.D> | *<X:X:X:X::X>*] | [key *<1-65534>]* | [minpoll *<4-17>*] | [version *<1-4>*] |	You can run the SNTP client and the NTP server concurrently on your system. Therefore you can obtain time from an outside source and serve that time to the devices connected to the router.
	Configure Network Time Protocol (NTP) for this interface.
	Network Time Protocol (NTP) is used distribute and maintain synchronization of time information between nodes in a network
	The router can provide the time to NTP/ SNTP capable client devices (or other Perle routers and IOLAN's etc).
	You can run the SNTP client and the NTP server concurrently on your system.
	Therefore you can obtain time from an outside source and serve that time to the devices connected to the router.
	Configure Network Time Protocol (NTP) for this interface.
	broadcast client—listens to NTP broadcasts
	destination broadcast—Configure broadcast destination address
	multicast client—listens to NTP multicasts
	destination multicast—multicast IPv4 or IPv6 address
	key—Configure broadcast authentication key.
	versions 1 to 4 are support.
	minimum poll interval is 4(16s), 5(32 s), 6 (1m 4s), 7(2m,8s), 8(4m,16s), 9(8m, 32s), 10 (17,m, 4s), 11 (34,m,8s). Default is 6
power efficient-ethernet auto |	Configure Ethernet interface power settings.

role lan | trusted | wan |	Select the role for this interface.
	LAN—management access is from the LAN side.
	WAN—management access is from the WAN side.
	Trusted—management access from either the LAN or WAN side.
service-policy in *<WORD>* | **out** *<WORD>*|	Assign traffic policy to this interface. Select whether the policy will apply to inbound or outbound traffic.
shutdown |	Shutdown this interface.
snmp trap interface-ip | link-status |	Set SNMP traps for interface and link status.

spanning-tree [bpdufilter enable | disable] | [bpduguard [disable | enable] | [cost <1-200000000>] | [guard loop | none | root | topology-change] | [link-type auto | point-to-point | shared] | mcheck] | [mst cost <1-200000000>] | [port-priority <0-240>] | [portfast disable | edge | network] |	Configure interface parameters for spanning tree.

bpdufilter—don't send or receive BPDUs on this interface.
Default is Disabled

bpduguard—don't accept BPDUs on this interface.
Default is Disabled

cost—change port path cost.
Value is 1 to 200000000.
Default is auto (defined by STP protocol)

guard

- loop
- none
- root
- topology-change

link-type

- auto—this interface is point-to-point if configured for full duplex operation
- point-to-point
- shared

mcheck—force the mode from STP to RSTP/MSTP mode

mst—change path cost and port priority for multiple spanning tree mode

port-priority—change the port priority for an instance.
(increments of 16)
Default is 128

portfast network—this feature causes the router to enter the STP forwarding-state immediately or upon a linkup event, thus passing the listening and learning states. Some applications need to connect to the network immediately, else they will timeout

portfast edge—is used to configure a port on which an end device is connected, such as a PC. All ports directly connected to end devices cannot create bridging loops in the network. Therefore, the edge port directly transitions to the forwarding state, and skips the listening and learning stages.

speed 10 |100 | 1000 |auto |	Configure the Ethernet speed ● 10 ● 100 ● 1000 ● auto
vrrp *<1-255>* |	This interface is part of VRRP group number.
zone-member security *<WORD>*}	This interface is a member of zone security.
Command Modes	Perle**(config-if-range)**#

Usage Guidelines

Set parameters for multiple Ethernet ports.

Examples

This example restricts IPv6 on Ethernet port range 1-2.

Perle(config)#interface range ethernet 1 , 2
Perle(config-if-range)#ipsec restrict

Configure IP parameters.

DDNS—

Service—use dyndns
login/password—configure the login id and
password for the dnydns server

Host/host-group—Hostname/list of
hostnames registered with the DDNS service

skip—skip everything before this ont he
given URL

Use-web URL—Enter the URL that you
want to obtain an IP address from. This
allows the router to be seen on the Internet as
a public address

DHCP–relay—set DHCP-relay for this
interface

Firewall—set firewall for inbound, traffic
destined for this router or outbound traffic

health-profile—use this health profile for
this interface, configure a nexthop interface

OSPF—

authentication/authentication-key—enables
message-digest authentication, text, or null.
Authentication-key 0 | 7 <WORD>

cost—Configure a default metric to be
applied to routes being distributed into OSPF.
Range is 0 to 16777214
Default is none

dead-interval—Configure the interval
during which at least one hello packet must
be received from a neighbor before the router
declares that neighbor as down (dead).) As
with the hello interval, this value must be the
same for all routers attached to a common
network.

Default is 4 times the hello interval
Default is 40 seconds

hello interval—Configure the hello packet
time interval for hello packets sent on an
interface.
The default is 10 seconds.

message-digest-key—Configure a password
used by neighboring routers for simple
password authentication. It can be any
continuous string of up to eight characters.

There is no default value.

- None—no password
- Key-ID—Configure an authentication key
- md5—Identifies the key (password) used between this router and neighboring routers for MD5

authentication.

- 0-unencrypted key will follow
- specifies a hidden key will follow
- specifies a password (key) will follow (max 16 characters).
  The default is none

mtu-ignore—By default, OSPF checks whether neighbors are using the same MTU on a common interface. Use this command to disable this check and allow adjacencies when the MTU value differs between OSPF neighbors.

network—Configure the network type

- broadcast—a designated router and backup designated router are elected using OSPF multicasting capabilities point-to-multipoint— configures selected routers with neighbor/cost parameters, identifying a specific cost for the connection to the specified peer neighbors and multicast is not required. Routers on an interface becoming neighbors should match the network type all

- point-to-point—there are only two neighbors and multicast is not required. Routers on an interface becoming neighbors should match the network type all. (most common type)

- point-to-multipoint—directs the network to treats point-to-multipoint networks as a collective of point-to-point links. Point-to-Multipoint networks do not maintain a DR/BDR relationship. Point-to-Multipoint networks advertise a hot route for all the frame-relay endpoints.

- non-broadcast—use this type of network on networks having no broadcast/ multicast capability, such as frame-relay, ATM, SMDS, & X.25. The key point is that these layer 2 protocols are unable to send broadcasts/multicasts

priority—a router with a high priority will always win the DR/BDR election process
Priority Range is 0-255
Default is 1

retransmit-interval—configure the time between retransmitting lost link advertisements) Time in seconds between link state advertisement retransmissions for adjacencies belonging to the interface,
The expected round-trip delay between any two routers in the attached network.
Range is 1–65535
Default is 5 second

transmit-delay—configure the transmit delay. The estimated time in seconds required to transmit a link state update packet on the interface.

route-policy—enable this policy route for this interface

rip—enable split horizon to prevent a routing loop in your network. Basically, information about the routing for a particular packet is never sent back in the direction from which it was received

Default is enabled

ipv6 [enable] | [firewall in | local |out] | | [nd dad attempt *<0-500>* | managed config-flag | other-config-flag | prefix *<X:X:X:X::X/<0-128> <0-4294967294>* | infinite | [ra dns server *<X:X:X:X::X>* | [hop-limit *<1-255>* | unspecified] | [interval *<4-1800> <3-1350>*] | [lifetime *<0>* | *<4-9000>*] | [suppress] | [reachable time *<0-3600000>*] | [retransmission-time *<0-3600000>*] | [router-preference high | low |medium] | [ifmtu] | [instance-id *<0-255>*] | [mtu-ignore] | [passive] | [priority *<0-255>*] | [retransmit -interval *<1-65535>*] | [transmit-delay *<1-65535>*] | [ospf [cost *<1-65535>*] | [dead-interval *<1-65535>*] | [hello-interval *<1-65535>*] | [instance-id *<0-255>*] | [mtu-ignore] | [passive] | [priority *<0-255>*] | [retransmit -

Configure IPv6 parameters.

enable—enable IPv6 on this interface

firewall—set firewall for inbound, traffic destined for this router or outbound traffic.

nd—IPv6 Interface Neighbor Discovery sub-commands

- dad (duplicate address detection) attempts—To check the uniqueness of an IPv6 address, a node sends Neighbor Solicitation messages. Use this command to specify the number of consecutive Neighbor Solicitation messages (dad_attempts) to be sent before this address can be configured. Range 1–600
  Default is 1
- managed config flags—specify whether hosts use the administrated protocol for address auto-configuration. Default is disabled (host uses stateless)
- prefix—specifies the IPv6 prefix advertised on the interface Configure the prefix length.
  Range is 0–128

interval *<1-65535>*] |
[transmit-delay *<1-65535>*] |
[ospf [cost *<1-65535>*] | [dead-interval *<1-65535>*] | [hello-interval *<1-65535>*] |
[instance-id *<0-255>*] | [mtu-ignore] | [passive] |
[priority*<0-255>*] |
[retransmit-interval *<1-65535>*] | [transmit-delay *<1-65535>*] | [policy route-policy *<WORD>*] | [rip | split-horizon disable | poisoned-reverse] |

no-autoconfig—A prefix is onlink when it is assigned to an interface on a specified link. Enable or disable prefix for onlink determination.
Default is off

no-onlink—The sending router can indicate that a prefix is to be used for address autoconfiguration by setting the autonomous flag and specifying a nonzero Valid Lifetime value for the prefix.
Default is off

ra—Router Advertisement Control

dns server—specify the name server in RA.

hop-limit—Specifies the Hop Count field of the IP header for outgoing (unicast) IP packets.
Range is 1–255
Default is 64

Interval—Specifies the maximum/minimum time allowed between sending unsolicited multicast router advertisements.

Range of minimum is 3 to *0.75 max (dynamic range)
Default maximum 600 seconds, minimum is 0.33*max
Range is 1–1800 in seconds

lifetime—The lifetime associated with the default router in seconds. A value of 0 indicates that the router is not a default router and doesn't appear on the default router list.

The router lifetime applies only to the router's usefulness as a default router,it does not apply to information contained in other message fields or options.
Range is 1–9000 seconds
Default is 1800 seconds
0 = not a default route

suppress—enable or disable IPv6 Router advertisements.
Default is send router advertisements

reachable time—specifies the length in time (milliseconds) a node assumes a neighbor is reachable after receiving a reachability confirmation
Default is 0 (unspecified by this router)
Range is 0-360000 milliseconds

retransmission-time—The retransmission timer is used to control the time (in milliseconds) between retransmissions of neighbor solicitation messages from the user equipment (UE).
Range 1–3600000 in milliseconds
Default is 0

router-preference—set the default router preference. A High value means this router will be preferred.

- **High**
- **Medium**
- **Low**

Default is medium

OSPF—
cost—Configure a default metric to be applied to routes being distributed into OSPF.
Range is 0 to 16777214
Default is none

dead-interval—Configure the interval during which at least one hello packet must be received from a neighbor before the router declares that neighbor as down (dead).) As with the hello interval, this value must be the same for all routers attached to a common network.

Default is 4 times the hello interval
Default is 40 seconds

hello interval—Configure the hello packet time interval for hello packets sent on an interface.
The default is 10 seconds.

ifmtu—The range is dynamic (depending on the interface type) and it will match with the MTU value set on the interface.
instance-id—instance ID for this interface
Values are 0–255

mtu-ignore—By default, OSPF checks whether neighbors are using the same MTU on a common interface. Use this command to disable this check and allow adjacencies when the MTU value differs between OSPF neighbors.

network—

- broadcast–Specify OSPF broadcast multi-access network
- point-to-point–Specify OSPF point-to-point network

passive—no adjacency will be formed on this interface

priority—a router with a high priority will always win the DR/BDR election process
Priority Range is 0-255
Default is 1

retransmit-interval—configure the time between retransmitting lost link advertisements) Time in seconds between link state advertisement retransmissions for adjacencies belonging to the interface,
The expected round-trip delay between any two routers in the attached network.
Range is 1–65535
Default is 5 second

transmit-delay—configure the transmit delay. The estimated time in seconds required to transmit a link state update packet on the interface.

route-policy—enable this policy route for this interface

rip—enable split horizon to prevent a routing loop in your network. Basically, information about the routing for a particular packet is never sent back in the direction from which it was received

logging event interface-ip | **link-status** |	Configure logging events for interface and link status.

ntp [broadcast client | destination <*A.B.C.D*>] | [key <*1-65534*>] | [minpoll <*4-17*>] | [version <*1-4*>] | [disable] | [multicast [<*A.B.C.D*> | <*X:X:X:X::X*> | client <*A.B.C.D*> | <*X:X:X:X::X*>] | [key <*1-65534*>] | [minpoll <*4-17*>] | [version <*1-4*>] |	Network Time Protocol (NTP) is used distribute and maintain synchronization of time information between nodes in a network The router can provide the time to NTP/ SNTP capable client devices (or other Perle routers and IOLAN's etc). You can run the SNTP client and the NTP server concurrently on your system. Therefore you can obtain time from an outside source and serve that time to the devices connected to the router.
	Configure Network Time Protocol (NTP) for this interface.
	broadcast client—listens to NTP broadcasts
	destination broadcast—Configure broadcast destination address
	multicast client—listens to NTP multicasts
	destination multicast—multicast IPv4 or IPv6 address.
	key—Configure broadcast authentication key.
	versions 1 to 4 are support.
	minimum poll interval is 4(16s), 5(32 s), 6 (1m 4s), 7(2m,8s), 8(4m,16s), 9(8m, 32s), 10 (17,m, 4s), 11 (34,m,8s). Default is 6
role lan | trusted | wan |	Select the role for this interface.
	LAN—management access is from the LAN side.
	WAN—management access is from the WAN side.
	Trusted—management access from either the LAN or WAN side.
service-policy in <*WORD*>| out <*WORD*> |	Assign traffic policy to this interface. Select whether the policy will apply to inbound or outbound traffic.
snmp trap interface-ip | link-status	Set SNMP traps for interface and link status.
zone-member security <*WORD*>}	This interface is a member of this zone security.
Command Modes	(config-if)#

Usage Guidelines
Set configuration parameters for OpenVPN tunnel.

Examples

This example sets SNMP to trap for link-status.

(config-if)#snmp trap link-status

Use the no form of this command to negate a command or set to defaults.

Syntax Description	(config-if)# tunnel
{**tunnel** *<0-999>* **mode [gre ip** | **ipv6ip 6in4]** |	Sets mode gre and ipv6up tunnel interface parameters.
arp disable-arp-filter | **enable-arp-accept** | **enable-arp-announce** | **enable-arp-ignore** | **enable-proxy-arp** | **timeout** *<1-2147483>* |	Configure ARP parameters. **Disable ARP filter**—If enabled the router responds to same ARP requests coming from multiple interfaces.
	Enable ARP Accept—Define behavior for gratuitous ARP frames who's IP is not already present in the ARP table: 0—don't create new entries in the ARP table 1—create new entries in the ARP table **Enable ARP Announce**—Define different restriction levels for announcing the local source IP address from IP packets in ARP requests sent on interface ● 0—(default) Use any local address, configured on any interface ● 1—Try to avoid local addresses that are not in the target's subnet for this interface. **Enable ARP Ignore**—Define different restriction levels for announcing the local source IP address from IP packets in ARP requests sent on interface ● 0—(default) Use any local address, configured on any interface ● 1—Try to avoid local addresses that are not in the target's subnet for this interface **ARP Timeout**—If an ARP entry is not used for a specific amount of time the entry is removed from the caching table. **Enable Proxy ARP**—Enable Proxy ARP if you need your router to respond to local networks with its MAC address. Default is Disabled

ip [address *<A.B.C.D>* *<A.B.C.D>***] | [ddns service dyndns | use-web skip** *<WORD>* **| url** *<WORD>***] | [dhcp-relay] | [firewall in | local | out** *<WORD>***] | [health-profile** *<WORD>* **nexthop** *<A.B.C.D>***] | [ospf authentication message-digest | null] | [authentication-key** *<LINE>***] | [cost** *<1-65535>***] | [dead-interval** *<1-65535>***] | [hello-interval** *<1-65535>***] | [message-digest-key** *<1-255>* **md5** *<LINE>***] | [mtu-ignore] |**	Configure IP parameters. **IP address/IP mask**—Configure the IP address/mask of this interface **secondary**—add secondary addresses) IP aliasing) for this interface **DHCP**—your address is assigned from a DHCP server **DDNS**— **Service**—use dyndns login/password—configure the login id and password for the dnydns server **Host/host-group**—Hostname/list of hostnames registered with the DDNS service **skip**—skip everything before this ont he given URL

[network broadcast | non-broadcast | point-to-point] | point-to-multipoint] | [priority <0-255>] | [retransmit-interval <1-65535>] | [transmit-delay <1-65535>] | [policy route-policy <WORD>] | [rip authentication key-chain<WORD> | mode md5 | text string 0 <WORD> | 7 <WORD> | <WORD> | [split-horizon disable | poisoned-reverse]

Use-web URL—Enter the URL that you want to obtain an IP address from. This allows the router to be seen on the Internet as a public address

DHCP client —

Class ID:

- Auto
- Line

Specify a Hex string or ASCII text. This same hex string or text would be configured on the server side and associated with an address to give the client.

Client ID:
This can be configured to be the Ethernet interface number, ASCII text, Hex string or set to Auto.

option—60—Vendor class identifier<oem-name>:<model>:<serial#> in ASCII Router example: Perle:IRG5541:350-01T00003

Hostname:
Specify a value for hostname option

DHCP–relay—set DHCP-relay for this interface

DNS dhcp—use DNS servers received from DHCP server for specified interface

Firewall—set firewall for inbound, traffic destined for this router or outbound traffic.

health-profile—use this health profile for this interface, configure a nexthop interface

OSPF—
authentication/authentication-key—enables message-digest authentication, text, or null. Authentication-key 0 | 7 <WORD>

cost—Configure a default metric to be applied to routes being distributed into OSPF. Range is 0 to 16777214
Default is none

dead-interval—Configure the interval during which at least one hello packet must be received from a neighbor before the router declares that neighbor as down (dead). As with the hello interval, this value must be the same for all routers attached to a common network.

Default is 4 times the hello interval
Default is 40 seconds

hello interval—Configure the hello packet time interval for hello packets sent on an interface.
The default is 10 seconds.

message-digest-key—Configure a password used by neighboring routers for simple password authentication. It can be any continuous string of up to eight characters. There is no default value.

- None—no password
- Key-ID—Configure an authentication key
- md5—Identifies the key (password) used between this router and neighboring routers for MD5

authentication.

- 0-unencrypted key will follow
- specifies a hidden key will follow
- specifies a password (key) will follow (max 16 characters).
  The default is none

mtu-ignore—By default, OSPF checks whether neighbors are using the same MTU on a common interface. Use this command to disable this check and allow adjacencies when the MTU value differs between OSPF neighbors.

network—Configure the network type

- broadcast—a designated router and backup designated router are elected using OSPF multicasting capabilities point-to-multipoint— configures selected routers with neighbor/cost parameters, identifying a specific cost for the connection to the specified peer neighbors and multicast is not required. Routers on an interface becoming neighbors should match the network type all
- point-to-point—there are only two neighbors and multicast is not required. Routers on an interface becoming neighbors should match the network type all. (most common type)

- point-to-multipoint—directs the network to treats point-to-multipoint networks as a collective of point-to-point links. Point-to-Multipoint networks do not maintain a DR/BDR relationship. , ATM, SMDS, & X.25. The key point is that these layer 2 protocols are unable to send broadcasts/multicasts

- non-broadcast—use this type of network on networks having no broadcast/multicast capability, such as frame-relay, ATM, SMDS, & X.25. The key point is that these layer 2 protocols are unable to send broadcasts/multicasts

priority—a router with a high priority will always win the DR/BDR election process
Priority Range is 0-255
Default is 1

retransmit-interval—configure the time between retransmitting lost link advertisements) Time in seconds between link state advertisement retransmissions for adjacencies belonging to the interface, The expected round-trip delay between any two routers in the attached network.
Range is 1–65535
Default is 5 second

transmit-delay—configure the transmit delay. The estimated time in seconds required to transmit a link state update packet on the interface. Link state advertisements in the update packet have their age incremented by this amount before transmission
Range is 1–65535
Default is 1 seconds

policy route-policy—enable this policy route for this interface.

rip—enable split horizon to prevent a routing loop in your network. Basically, information about the routing for a particular packet is never sent back in the direction from which it was received.
Default is enabled

ipsec restrict		Restrict IPsec on this interface.

ipv6 [address *<X:X:X:X::X/<2-128>* **eui-64] | [enable] | [firewall in | local | out** *<WORD>***] | [nd dad attempts** *<0-600>* **| managed config-flag | other-config-flag | prefix** *<X:X:X:X::X/<0-128> <0-4294967294>* **| infinite] | [ra dns server** *<X:X:X:X::X>* **| hop-limit** *<1-255>* **| unspecified] | interval** *<4-*

address—specify an IPv6 address.

enable—enable IPv6 on this interface.

firewall—set firewall for inbound, traffic destined for this router or outbound traffic

nd—IPv6 Interface Neighbor Discovery sub-commands

- dad (duplicate address detection) attempts—To check the uniqueness of an IPv6 address, a node sends Neighbor Solicitation messages.

1800> <3-1350 | lifetime <0>
<4-9000> | suppress |
reachable time *<0-3600000>* |
**retransmission-time *<0-*
***3600000>* | router-preference**
high | low | medium] | [ospf
cost *<1-65535>* | [dead-interval
***<1-65535>*] | [hello-interval**
***<1-65535>*] | [ifmtu] |**
[instance-id *<0-255>*] | [mtu-
ignore] | [network broadcast |
point-to-point | [passive] |
[priority *<0-255>*] |
[retransmit-interval *<1-
***65535>*] | [transmit-delay *<1-**
***65535>*] | [policy route-policy**
***<WORD>*] | [rip | split-horizon**
disable | poisoned-reverse] |

- Use this command to specify the number of consecutive Neighbor Solicitation messages (dad_attempts) to be sent before this address can be configured.
Range 1–600
Default is 1
- managed config flags—specify whether hosts use the administrated protocol for address auto-configuration.
Default is disabled (host uses stateless)
- other-config-flags—specify whether hosts use the administrated protocol for non-address auto-configuration information.
Default is disabled (hosts use stateless auto-configuration of no-address information
- prefix—specifies the IPv6 prefix advertised on the interface Configure the prefix length.
Range is 0–128

no-autoconfig—A prefix is onlink when it is assigned to an interface on a specified link. Enable or disable prefix for onlink determination.
Default is off

no-onlink—The sending router can indicate that a prefix is to be used for address autoconfiguration by setting the autonomous flag and specifying a nonzero Valid Lifetime value for the prefix.
Default is off

ra—Router Advertisement Control

dns server—specify the name server in RA.

hop-limit—Specifies the Hop Count field of the IP header for outgoing (unicast) IP packets.
Range is 1–255
Default is 64

ra—Router Advertisement Control

dns server—specify the name server in RA.

hop-limit—Specifies the Hop Count field of the IP header for outgoing (unicast) IP packets.
Range is 1–255
Default is 64

Interval—Specifies the maximum/minimum time allowed between sending unsolicited multicast router advertisements.
Range of minimum is 3 to *0.75 max (dynamic range)
Default maximum 600 seconds, minimum is 0.33*max
Range is 1–1800 in seconds

lifetime—The lifetime associated with the default router in seconds. A value of 0 indicates that the router is not a default router and doesn't appear on the default router list. The router lifetime applies only to the router's usefulness as a default router; it does not apply to information contained in other message fields or options.
Range is 1–9000 seconds
Default is 1800 seconds
0 = not a default route

suppress—enable or disable IPv6 Router advertisements.
Default is send router advertisements

reachable time—specifies the length in time (milliseconds) a node assumes a neighbor is reachable after receiving a reachability confirmation
Default is 0 (unspecified by this router)
Range is 0-360000 milliseconds

retransmission-time—The retransmission timer is used to control the time (in milliseconds) between retransmissions of neighbor solicitation messages from the user equipment (UE).
Range 1–3600000 in milliseconds
Default is 0

router-preference—set the default router preference. A High value means this router will be preferred.

- **High**
- **Medium**
- **Low**

Default is medium

	OSPF— **cost**—Configure a default metric to be applied to routes being distributed into OSPF. Range is 0–16777214 Default is 4 times the hello interval Default is 40 seconds **dead-interval—**Configure the interval during which at least one hello packet must be received from a neighbor before the router declares that neighbor as down (dead).) As with the hello interval, this value must be the same for all routers attached to a common network. **hello interval—**Configure the hello packet time interval for hello packets sent on an interface. Default is none Default is enabled The default is 10 second **ifmtu**—The range is dynamic (depending on the interface type) and it will match with the MTU value set on the interface. **instance-id—**instance ID for this interface Values are 0–255 **passive**—no adjacency will be formed on this interface **network**— broadcast– **priority**—a router with a high priority will always win the DR/BDR election process Priority Range is 0-255 Default is 1 **policy route-policy**—enable this policy route for this interface. **rip**—enable split horizon to prevent a routing loop in your network. Basically, information about the routing for a particular packet is never sent back in the direction from which it was received
logging event interface-ip | **link-status** |	Configure logging events for interface and link status.
mtu *<64-9000>* |	Configure maximum transmission unit (MTU). Values are 64-9000 Default is 1476

ntp [broadcast client | **destination <*A.B.C.D*>] | [key** **<*1-65534*>] | [minpoll <*4-17*>]** **| [version <*1-4*>] | [disable] |** **[multicast [<*A.B.C.D*> |** **<*X:X:X:X::X*> | client** **<*A.B.C.D*> | <*X:X:X:X::X*>] |** **[key <*1-65534*>] | [minpoll <*4-* 17*>] | [version <*1-4*>] |**	Network Time Protocol (NTP) is used distribute and maintain synchronization of time information between nodes in a network The router can provide the time to NTP/SNTP capable client devices (or other Perle routers and IOLAN's etc).
	You can run the SNTP client and the NTP server concurrently on your system. Therefore you can obtain time from an outside source and serve that time to the devices connected to the Router.
	Configure Network Time Protocol (NTP) for this interface.
	broadcast client—listens to NTP broadcasts
	destination broadcast—Configure broadcast destination address
	multicast client—listens to NTP multicasts
	destination multicast—multicast IPv4 or IPv6 address
	key—Configure broadcast authentication key
	versions 1 to 4 are support.
	minimum poll interval is 4(16s), 5(32 s), 6 (1m 4s), 7(2m,8s), 8(4m,16s), 9(8m, 32s), 10 (17,m, 4s), 11 (34,m,8s) Default is 6
role lan | trusted | wan |	Select the role for this interface.
	LAN—management access is from the LAN side
	WAN—management access is from the WAN side
	Trusted—management access from either the LAN or WAN side
service-policy in <*WORD*> | **out <*WORD*> |**	Assign traffic policy to this interface. Select whether the policy will apply to inbound or outbound traffic.
shutdown |	Shutdown this interface.
snmp interface-ip | link-status **|**	Configure SNMP traps for interface and link status.

Configure IPv6 parameters.

IPv6 address/IP mask—Configure the IP address/mask of this interface

enable—enable IPv6 on this interface.

firewall—set firewall for inbound, traffic destined for this router or outbound traffic.

nd—IPv6 Interface Neighbor Discovery sub-commands.

- dad (duplicate address detection) attempts—To check the uniqueness of an IPv6 address, a node sends Neighbor Solicitation messages. Use this command to specify the number of consecutive Neighbor Solicitation messages (dad_attempts) to be sent before this address can be configured. Range 1–600
  Default is 1
- managed config flags—specify whether hosts use the administrated protocol for address auto-configuration. Default is disabled (host uses stateless)
- other-config-flags—specify whether hosts use the administrated protocol for non-address auto-configuration information.

Default is disabled (hosts use stateless auto-configuration of no-address information

- prefix—specifies the IPv6 prefix advertised on the interface Configure the prefix length.
  Range is 0–128

no-autoconfig—A prefix is onlink when it is assigned to an interface on a specified link. Enable or disable prefix for onlink determination.
Default is off

Default is disabled (hosts use stateless auto-configuration of no-address information

- prefix—specifies the IPv6 prefix advertised on the interface Configure the prefix length.
  Range is 0–128

no-onlink—The sending router can indicate that a prefix is to be used for address autoconfiguration by setting the autonomous flag and specifying a nonzero Valid Lifetime value for the prefix.
ra—Router Advertisement Control

dns server—specify the name server in RA.

hop-limit—Specifies the Hop Count field of the IP header for outgoing (unicast) IP packets.
Range is 1–255
Default is 64

interval—The maximum time interval between sending unsolicited multicast router advertisements from the interface, in seconds.
Range is 4-1800 seconds
minimum 3-1350
Default is 1800 seconds
0 = not a default route

lifetime—The lifetime associated with the default router in seconds. A value of 0 indicates that the router is not a default router and doesn't appear on the default router list. The router lifetime applies only to the router's usefulness as a default router; it does not apply to information contained in other message fields or options.
Range is 4-9000 seconds
Default is 3 x the max-interval
0 = not a default route

suppress—enable or disable IPv6 Router advertisements.
Default is send router advertisements

	reachable time—specifies the length in time (milliseconds) a node assumes a neighbor is reachable after receiving a reachability confirmation Default is 0 (unspecified by this router) Range is 0-360000 milliseconds
	retransmission-time—The retransmission timer is used to control the time (in milliseconds) between retransmissions of neighbor solicitation messages from the user equipment (UE). Range 1–3600000 in milliseconds Default is 0
	reachable time—specifies the length in time (milliseconds) a node assumes a neighbor is reachable after receiving a reachability confirmation Default is 0 (unspecified by this router) Range is 0-360000 milliseconds
	retransmission-time—The retransmission timer is used to control the time (in milliseconds) between retransmissions of neighbor solicitation messages from the user equipment (UE). Range 1–3600000 in milliseconds Default is 0
	router-preference—set the default router preference. A High value means this router will be preferred. **High** **Medium** **Low** Default is medium
	policy route-policy—enable this policy route for this interface.
logging event interface-ip | **link-status** |	Configure logging events for interface and link status.
mtu *<64-9000>* |	Configure maximum transmission unit (MTU). Values are 64 to 9000 bytes Default is 1500 bytes

ntp [broadcast client | destination <A.B.C.D>] | [key <1-65534>] | [minpoll <4-17>] | [version <1-4>] | [disable] | [multicast [<A.B.C.D> | <X:X:X:X::X> | client <A.B.C.D> | <X:X:X:X::X>] | [key <1-65534>] | [minpoll <4-17>] | [version <1-4>] |	Network Time Protocol (NTP) is used distribute and maintain synchronization of time information between nodes in a network The router can provide the time to NTP/SNTP capable client devices (or other Perle routers and IOLAN's etc).

You can run the SNTP client and the NTP server concurrently on your system. Therefore you can obtain time from an outside source and serve that time to the devices connected to the router.

Configure Network Time Protocol (NTP) for this interface.

broadcast client—listens to NTP broadcasts
destination broadcast—Configure broadcast destination address.

multicast client—listens to NTP multicasts.

destination multicast—multicast IPv4 or IPv6 address.

key—Configure broadcast authentication key.

versions 1 to 4 are support.
minimum poll interval is 4(16s), 5(32 s), 6 (1m 4s), 7(2m,8s), 8(4m,16s), 9(8m, 32s), 10 (17,m, 4s), 11 (34,m,8s)
Default is 6

peer-address <A.B.C.D>	Configure an unicast VRRP peer IP address.
preempt delay <0-1000>	By default, the preemption delay is 0, indicating immediate preemption. In immediate preemption mode, a backup immediately switches to the master when detecting that its priority is higher than the master's priority. Delay is 0 to 1000 in seconds. Disabled—Even if a VRRP router with a higher priority than the current master is up, it does not replace the current master. Only the original master (when it becomes available) replaces the backup. Values 1-000 seconds Default is 0 (no delay)
priority <1-255>	The priority value for the VRRP router that owns the IP address(es) associated with the virtual router. Values are 1-255 Default is 100

role lan | trusted | wan |	Select the role for this interface. **LAN**—management access is from the LAN side. **WAN**—management access is from the WAN side. **Trusted**—management access from either the LAN or WAN side.
shutdown |	Shutdown this interface.
snmp trap interface-ip | link status |	Configure SNMP traps for interface and link status.
sync-group *\<WORD>* |	Adds this sync VRRP group to a sync group. Sync groups are used to link VRRP groups together in order to propagate transition changes from one group to another group.
sync-group *\<WORD>* |	Assign this interface to a sync group. Adds this sync VRRP group to a sync group. Sync groups are used to link VRRP groups together in order to propagate transition changes from one group to another group. To clarify, in a VRRP synchronization group ("sync group") are synchronized such that, if one of the interfaces in the group fails over to backup, all interfaces in the group fail over to backup. For example, if one interface on a master router fails, **Note:** VRRP groups in a sync group must have similar priority and preemption configurations. Before enabling a sync-group you should verify that one routeris master of both groups and the other is backup of both groups. If both side think they are master of the same group, then enabling a sync group can cause endless transitioning to get in sync.
timers *\<10-255000>* |	Configure the time interval between the advertisement packets that are being sent to other Virtual Router Redundancy Protocol (VRRP) routers in the same group Values are 10–255000 milliseconds Default is 1000 milliseconds
version |	Configure the version number. Values are 2–3 Default is 3

zone-member security **_<WORD>_**}	This interface is a member of this zone security.

Command Modes	Perle(config-if-vrrp)#

Usage Guidelines

Use this command to configure VRRP parameters.
Your router supports the Virtual Router Redundancy Protocol (VRRP).

VRRP is an election and redundancy protocol that dynamically assigns the responsibility of a virtual router to one of the physical routers on a LAN.

This increase the availability and reliability of routing paths in the network. In VRRP, one physical router in a virtual router is elected as the master, with the other physical router of the same virtual router acting as backups in case the master fails. The physical routers are referred as VRRP routers.

The default gateway of a participating host is assigned to the virtual router instead of a physical router. If the physical router is routing packets on behalf of the virtual router fails, another physical router is selected to automatically replace it. The physical router forwarding packets at any given time is called the master router.

Examples

This example sets VRRP for version 2.

Perle(config)#interface ethernet 2

Perle(config-if)#vrrp 10

Perle(config-if-vrrp)#version 2

⑥ Interface line mode

This chapter defines all the CLI commands associated with configuring the console and tty ports. Some CLI commands may not be applicable to your model or running software.

line

line {**console** *<0-0>* | **tty** *<1-2>* | **vty**}

Use the no form of this command to negate a command or set to defaults.

Syntax Description	line
{**console** *<0-0>* |	Applies only to models with serial ports. Configure console port parameters.
tty *<1-2>*|	Applies only to models with serial ports. Configure tty port parameters.
vty}	Configure vty port parameters.
Command Modes	Perle>enable Perle>config Perle#line

Usage Guidelines

Use this command to change to line mode.

Examples

This example set terminal width to 80.

Perle(config)#line vty
Perle(config-line)#width 80

Related Commands

(config-line)#tty

(config-line)#console

{**accounting exec** *<WORD>* | **default** |
authorization exec *<WORD>* | **default** |
databits 7 | **8** |
exec |
exec-timeout *<0-35791> <0-2147483>* |
history size *<0-256>* |
length *<0-512>* |
login authentication *<WORD>* | **default** |
media-interface null | **tty** | **usb** | **parity even** | **odd** | **none** |
speed | **115200** | **19200** | **38400** | **57600** | **9600** |
stopbits 1 | **2** |

timeout login response *<1-300>* |
transport output all | none | ssh | telnet |
width *<0-512>*}

Use the no form of this command to negate a command or set to defaults.

Syntax Description	**(config-line)#console** This command applies only to models with console port/s.
{**accounting exec** *<WORD>* | **default** |	Use an accounting list with a specified name or default list.
authorization exec *<WORD>* | **default** |	Use an authorization with a specified name or default list.
databits 7 | 8 |	Type 7 or 8 to set data bits.
exec |	Enables EXEC CLI session
exec-timeout *<0-35791> <0-2147483>* |	Configure the console session CLI timeout. Values are 0 to 35791 in minutes Default is 5 minutes
history size *0-256>* |	Configure the size of the history buffer.
length *0-512>* |	Configure the number of lines displayed on the screen. Type 0 for no pausing at end of page.
login authentication *<WORD>* | **default** |	Use the specified list for authentication requests or use the default list.
media-interface null | tty | usb |	Configure media interface type. • use null for no console port • use tty for serial port as the console port • use usb as the console port
parity even | odd | none |	Configure parity for console mode.
speed | 115200 | 19200 | 38400 | 57600 | 9600 |	Set the speed for this interface. • 115200 • 19200 • 38400 • 57600 • 9600
stopbits 1 | 2 |	Configure stop bits for console mode.
timeout login response *<1-300>* |	Configure timeout for user responses during the login sequence.

transport output all | none | ssh | telnet |	Allows the user on the console port to telnet or ssh out of the .
width *<0-512>*}	Configure the width of the terminal display.

Command Default	console 0
	timeout login response 30
	login authentication default
	databits 8
	parity none
	stopbits 1
	speed 9600

Command Modes	Perle>enable
	Perle>config
	Perle(config)#line config 0
	Perle(config-line)#

Usage Guidelines

Use these commands to set parameters for console mode.

Examples

These commands sets your console to speed 38400, databits 7 and stopbits 2.

Perle(config-line)#speed 38400
Perle(config-line)#databits 7
Perle(config-line)#stopbits 2

off | on}

Use the no form of this command to negate a command or set to defaults.

Syntax Description	**(config-line)#tty**
	Applies only to models with serial ports.
{break break-interrupted | local | off | remote |	Configure how the break signal is interpreted from the peer. Data Range: ● None—The router ignores the break key completely and it is not passed through to the host. ● Local—The router deals with the break locally. If the user is in a session, the break key has the same effect as a hot key. ● Remote—When the break key is pressed, the router translates this into a telnet break signal which it sends to the host machine. ● Break Interrupt—On some systems such as SunOS, XENIX, and AIX, a break received from the peripheral is not passed to the client properly. If the client wishes to make the break act like an interrupt key (for example, when the stty options—ignbrk and brkintr are set. Default is None
break-delay *<1-65535>* **|**	This parameter defines the delay between the termination of a a break condition and the time data is sent out the serial port. Default is 0 ms (no delay).
break-length *1-65535>* **|**	When the router receives a command from its peer to issue a break signal, this parameters defines the length of time the break condition is asserted on the serial port Default is 1000ms (1 second)

connection-method dial-in | **dial-out** | **dial-in-out** | **direct-connect** | **ms-direct-guest** | **ms-direct-host** |	**Dial in**—Enable this parameter if the device is remote and is dialing via a modem or ISDN TA Default is Disabled **Dial out**—Enable this parameter if the device if you want the modem to dial a number when the serial port is started. Default is Disabled
cts-toggle off | **on** |	Configure CTS toggle. Default is Off
cts-toggle-final-delay *<0-1000>* |	Configure CTS final delay in milliseconds. Value is 1–1000
cts-toggle-inital-delay *<0-1000>* |	Configure CTS initial delay in milliseconds. Value is 1–1000
databits 5 | **6** | **7** | **8** |	Configure the data bits for this connection. Data bit options are
data-logging off | **on** |	When enabled, serial data is buffered if the TCP connection is lost. When the TCP connection is re-established, the buffered serial data is sent to its destination. If using the Trueport profile, data logging is only supported in Lite mode. When the data buffer fills, incoming serial data overwrites the oldest data. The minimum data buffer size is 4K. The maximum data buffer size is 256K. **Note:** A kill line or a reboot of the router causes all buffered data to be lost. Some profile features are not compatible with the data logging feature.
dial-retries *<0-99>* |	Configure the number of times the router attempts to re-establish a connection with a remote modem. Range is 0–99 Default is 2

dial-timeouts *<0-99>* |	Configure the number of seconds the router waits to establish a connection to a remote modem. Range is 1–99 Default is 45 seconds
discard-characters-rxd-with-errors off |on |	When enabled, therouter discards characters received with a parity or framing error. Default is Disabled
echo-suppression off | on |	This parameter applies to EIA-485 half-duplex mode, all characters are echoed to the user and transmitted across the serial ports. Some EIA-485 applications require local echo to be enabled in order to monitor the loopback data to determine that line contention has occurred. If your application cannot handle loopback data, echo suppression should be enabled. Default is Off
flow both | hard | none | soft |	Configure handling of the data flow. Choose software (soft), hardware (hard), both or none. If you are using SLIP, set to Hard only. If you are using PPP set to either soft or hard (hard is recommended). If you select soft with PPP, you must set the ACCM parameter when you configure PPP for the serial port. Default is None
flowin off | on |	Configure for flowin control. Default is On
flowout off on |	Configure for flowout control. Default is On
hotkey-prefix *<0-ff>* |	Configure the prefix that a user types to lock a serial port or redraw the Menu. Data Range: • ^a l—(Lowercase L) Locks the serial port until the user unlocks it.

	• ^a l—(Lowercase L) Locks the serial port until the user unlocks it. The user is prompted for a password (any password, excluding spaces) and locks the serial port. Next, the user must retype the password to unlock the serial port.
	• ^r—When you switch from a session back to the Menu, the screen may not be redrawn correctly. If this happens, use this command to redraw it properly. This is always Ctrl R, regardless of the Hot Key prefix.
	You can use the Hotkey Prefix to lock a serial port only when the Allow Port Locking parameter is enabled.
	Default is hexadecimal 01 (Ctrl-a, ^a)
idle-timer *<0-4294967>* |	Configure the inactivity timer to close a connection due to inactivity. When the idle timeout expires, the router ends the connection.
	Range is 0–4294967 seconds (about 49 days)
	Default is 0 seconds so the port never times out.
initiate-connection any-char | **specific-char** *<0-ff>* |	Configure the initiate a connection parameter
	● Initiates a connection to the specified host when any data is received on the serial port.
	● Initiates a connection to the specified host only when the specified character is received on the serial port. Default is Disabled
	Default is Disabled
internet address *<A.B.C.D>* | *<X:X:X::X>* |	Configure the Internet address of this serial port.
keepalive off | **on** |	Configure the TCP keepalive option. This parameter is used in conjunction with the Monitor Connection Status Interval parameter found under config *serial*.

	The connection is monitored based on the monitor connection status interval timer. This timer specifies the inactivity period before "testing" the connection. Should the end device not respond, the connection will be dropped.
	Note: If a network connection is accidentally dropped, it can take as long as the specified interval before reconnecting to the serial port.
	Default is Off
lock off | **on** |	When enabled, the user can lock his terminal with a password using the hotkey prefix (ctrl-a) ^a (lowercase L). The router prompts the user for a password and a confirmation. Default is Off.
map-cr-crlf off | **on** |	Configure to map carriage returns (CR) to carriage return line feed (CRLF). Default is off
modbus [master crlf | **entry** | **protocol]** | **[slave cflf** | **protocol** | **uid-range]** |	Configure Modus master/ slave parameters. Default is enabled
modem-init-string *<WORD>* |	Configure the initialization string to send to the modem.
monitor-dsr-dtr on | **off** |	Configure monitor for dsr-dtr signals.
motd off | **on** |	Configure enables/disables the message of the day. Default is Disabled
multihost entry *<1-49>* *<A.B.C.D>* | *<X:X:X::X>* **port** *<1-65535>* |	Adds a multihost entry to the multihost table. Range 1 to 49 Port number 1 to 65535
multisessions *<1-8>* |	Configure the number of extra network connections available on a serial port, in addition to the single session that is always available. Enabling multisessions permits multiple users to monitor the same console port. Range is 1 to 8 Default is 0
name *<WORD>* |	Configure a name.

packet-forwarding delay-between-messages *<1-65535>* | **[enable-end-tigger1 on | off]** | **[enable-end-tigger2 on | off]** | **[enable-eof1 on | off]** | **[enable-eof2 on | off]** | **[enable-sof1 on | off]** | **[enable-sof2 on | off]** | **end-trigger1** *<0-0xff>* | **end-trigger2** *<0-0xff>* | **eof1***<0-0xff>* | **eof2***<0-0xff>* | **force-transmit-timer** *<1-65535>* | **[forwarding-rule strip-trigger | trigger | trigger+1 | trigger+2]** | **idle-timer** *<1-65535>* | **[mode custom-on-frame-definition | custom-on-specific-events | minimize-latency | optimize-network-throughput | prevent-message-fragmentation]** | **packet-size** *<1-1024>* | **sof1***<0-0xff>* | **sof2***<0-0xff>* | **start-frame-transmit off | on** |	Configure packet forwarding rules. The packet is transmitting on the first criteria that is met. For example, if you set a force transmit timer of 1000 ms and a packet size of 100 bytes whichever criteria is first causes the packet to be transmitted. Default is Disabled
pages *<1-7>* |	Configure the number of video pages the terminal supports. Range: 1 to 7 Default is 5 pages
parity even | mark | none | odd | space |	Configure the parity type. Data Options are: ● Even ● Odd ● Mark ● space ● none
phone-number *<number>* |	Configure the phone number to use when Dial Out is enabled.
ppp accm *<8 hex digits>* | **[address-comp on | off]** | **auth-tmout** *<1-255>* | **[authentication chap | pap | none]** | **challenge-interval** *<0-255>* | **cr-retry** *<0-255>* | **cr-timeout** *<1-255>* | **[dynamic-dns on | off hostname | password | username** *<WORD>*]	Configure PPP parameters. **SLIP**—The IPv4 address of the router end of the SLIP link. For routing to work you must enter an IP address in this field. Choose an address that is part of the same network or subnetwork as the remote end; for example, if the remote end is address

echo-retry *<0-255>* | **echo-timeout** *<0-255>* | **[ipaddr-neg on | off]** | **ipv6-global-network-prefix** *<WORD>* | **ipv6-local-interface** *<WORD >* | **ipv6-remote interface** *<WORD>* | **lipaddr** *<A.B.C.D>* | **magic-neg on | off** | **mtu** *<64-1500>* | **[ms-direct host | guest]** | **nak-retry** *<0-255>* | **netmask** *<A.B.C.D>* | **password** *<word>* | **[proto-comp off | on]** | **ripaddr** *<A.B.C.D>* | **[roaming-callback off | on]** | **[routing listen | none | send | send-and-listen]** | **rpassword** *<WORD>* | **ruser** *<WORD>* | **tr-retry** *<0-255>* | **tr-timeout** *<1-255>* | **user** *<WORD>* | **vj-comp on | off** |	192.101.34.146, your local IP address can be 192.101.34.145. Do not use the router's (main) IP address in this field; if you do so, routing does not take place correctly. **MTU**—The Maximum Transmission Unit (MTU) parameter restricts the size of individual SLIP packets being sent by the router. Enter a value between 256 and 1500. The default value is 256. If your user is authenticated by Radius, this value is overwritten when you have set a Framed MTU in the RADIUS server.
reset off | on |	When enabled, resets the terminal definition connected to the serial port when a user logs out. Default is Disabled
rev-session-security off | on |	Configure reverse telnet session authentication.
rlogin-client termtype *<WORD>* |	Configure the terminal type for rlogin sessions.
rts-toggle off | on |	Configure RTS toggle. Default is Off
rts-toggle-final-delay *<0-1000>* |	Configure RTS final delay in milliseconds. Value is 1–1000
rts-toggle-inital-delay *<0-1000>* |	Configure RTS initial delay in milliseconds. Value is 1–1000
send-name off | on |	Configure the port name to be sent to the host when session is initiated. This is done before any other data is sent or received to/from the host. Default is Disabled
send-port-id off | on |	Configure port-id to send.

service bidir *<A.B.C.D> <1-65535> <1-65535>* |	Configure service type for bidir. Use bidir for TCP Sockets, Reverse and Silent connections. Configure the host to connect to, server port number and host port number.
service client-tunnel *<A.B.C.D> <1-65535>* |	Configure service type to client-tunnel. Configure the Enter the host to connect to and host port number.
service direct raw *<A.B.C.D>* | **rlogin** *<A.B.C.D>* | **ssh** *<1-65535>* | **telnet** *<A.B.C.D> <1-65535>* |	Configure service type as direct raw.
service dslogin |	Connects to the serial port in Command Line Interface (CLI) mode on this port.
service modbus-master |	Configure service type as modbus master.
service modbus-slave |	Configure service type as modbus slave.
service ppp |	Configure service type as PPP for this serial port.
service printer |	Configure service type as printer.
service reverse raw [multihost on | off | tcp-port *<1-65535>* | **multihost] | ssh** *<1-65535>* | **telnet** *<1-65535>* |	Configure parameters for a reverse raw connection.
service server-tunnel *<1-65535>* |	Configure service to server tunnel connection.
service silent raw *<1-65535>* | **multihost all | backup** *< A.B.C.D> <1-65535> <1-65535>* | **none** |	Configure service type as silent raw parameters. **Multihost**–used for connections coming from the network to the serial port for Trueport or Raw. Multihost all allows multiple hosts to connect to the serial port. **Backup**–Multihost in primary backup mode.

service silent raw *<1-65535>* | **multihost all | backup <** *A.B.C.D> <1-65535> <1-65535>* | **none** |	Configuration service type as silent raw parameters. **Multihost**–used for connections coming from the network to the serial port for Trueport or Raw. Multihost all, allows multiple hosts to connect to the serial device. **Backup**–used for connections going from the serial port to the network for Trueport or Silent Raw connections to either all the hosts in the multi-host list or a primary/ backup host.
service slip |	Configure service type as slip.
service trueport client-initiated off *<A.B.C.D> <1-65535>* **[multihost all | backup | none] signal-active off | on]** | **on** *<1-65535>* **[multihost all | backup | none] | signal-active off | on** |	Configure service type as trueport.
service udp *<1-65535>* |	Configure service type as udp.
service vmodem *<1-65535>* |	Configure service type as modem.
sess-timer *<0-4294967>* |	Configure session timer to forcibly close the session/connection when the Session Timeout expires. Default is 0 seconds so that the port never timeouts. Range is 0 to 294967 seconds (about 49 days)

session-strings delay*<0-65535>* **| initiate** *<WORD>* **| terminate** *<WORD>* **|**	Configure session string delay options. **Delay after Send**—If configured, a delay time is sent to the device. This delay is used to provide the serial device time to process the string before the session is initiated. **Initiate at Start**—If configured, this string is sent to the serial device on the power-up of the router or when a kill line command is issued on this serial port. If the "monitor DSR" or "monitor DCD" options are set, the string is also sent when the monitored signal is raised. **Range is** 0–127 alpha-numeric characters. Non printable ascii characters must be entered in this format <027>. The decimal numbers within the brackets must be 3 digits long (example 003 not 3) **Send at Terminate**—If configured, this string is sent to the serial device when the TCP session on the LAN is terminated. If multi-host is configured, this string is only sent in listen mode to the serial device when all multi-host connections are terminated.
	Range is 0–127 alpha-numeric characters. Non printable ascii characters must be entered in this format <027>. The decimal numbers within the brackets must be 3 digits long (example 003 not 3)

telnet-client echo *<0-0x7f>*| **eof** *<0-0x7f>* | **erase** *<0-0x7f>* | **escape** *<0-0x7f>* | **intr** *<0-0x7f>* | **line-mode off | on | local-echo off | on | map-cr-crlf on | off | quit** *<0-0x7f>* | **termtype** *<WORD>* |

echo—toggles between local echo of entered characters and suppressing local echo. Local echo is used for normal processing, while suppressing the echo is convenient for entering text that should not be displayed on the screen, such as passwords. This parameter can be used only when Enable Line mode is enabled.
Default is Disabled

eof—Defines the end-of-file character. When enabled Line mode is enabled, entering the EOF character as the first character on a line sends the character to the remote host.
This value is in hexadecimal.
Default is 4 (ASCII value ^D)

This parameter can be used only when Enable Line mode is enabled.
Default is Disabled

erase—Defines the erase character. When Line mode is off, typing the erase character erases one character.

This value is in hexadecimal.
Default is 8 (ASCII value ^H)

escape—Defines the escape character. Returns you to the command line mode. This value is hexadecimal.
Default is 1d (ASCII value GS)

line mode—When enabled, keyboard input is not sent to the remote host until Enter is pressed, otherwise input is sent every time a key is pressed.
Default is Disabled

	local echo—Toggles between local echo of entered character and suppressing local echo Local echo is used for normal processing, while suppressing the echo is convenient for entering text that should not be display on the screen such as passwords.
	This parameter can only be used when Enable Line Mode is enabled. Default is Disabled
	map cr to crlf—When enabled, maps carriage return (CR) to carriage return/ line feed (CR/LF). Default is Disabled
	quit—defines the quit character. Typing the quit character closes and exits the current telnet session.
	This value is in hexadecimal. Default is 1c (ASCII value FS)
termtype ansi | dumb | hp700 | ibm3151te | term1 | term2 | term3 | tvi925 | vt100 | vt320 | wyse60 |	Configure a terminal type.
tx-driver-control auto | rts |	Used for RS-485 to determine what controls the Tx data envelop.
	auto - driver controls
	rts - application controls by manipulating the rts signal.
	Default is auto
tx-driver-control auto | rts |	Configure tx driver control to either auto or RTS.
udp entry _<1-4>_ | [both | in | out | none] | auto-learn _<A.B.C.D>_ | _<X:X:X:X::X>_ specific _<1-65535> <A.B.C.D>_ | _<X:X:X:X::X>_| in any-port _<A.B.C.D>_ | _<X:X:X:X::X>_ _<A.B.C.D>_ | _<X:X:X:X::X>_ | none | out _<1-65535>_ _<A.B.C.D>_ | _<X:X:X:X::X>_ |	Configure a udp entry— For each entry you specify a different IP address range, udp port, and the direction of data flow.
	both | in | out | none
	The direction in which information is received or relayed:
	both—both directions
	in—LAN to serial. The router listens on the port value configured in the DS Port parameter for messages coming from the learned or configured port.

	out—Serial to LAN. The router forwards data received on the serial port to the IP address range, UDP port configured for this entry. **none**—UDP service not enabled. **auto-learn**—The router only listens to the first port that it receives a UDP packet from. Auto learn is applicable when direction is set to In or Both. **any-port**—The router receives messages from any port sending UDP packets Applicable when direction is set to In. **specific**—The port that the router listens for UDP packets, configured using the DS port parameter. **<*start_IP_address*>** The first host IP address in the range of IP addresses (for IPV4 or IPV6) that the router listens for messages from and/or send messages to. **<*end_IP_address*>** The last host IP address in the range of IP addresses (for IPV4, not required for IPV6) that the router listens for messages from and/or send messages to.
user *<WORD>* **|**	Configure a user name.
**vmodem echo off	on] |** **[failure-string** *<WORD>***] |** **[host** *<A.B.C.D>* **|** *<X:X:X:X::X>***]	[init-string** *<WORD>* **| mode [auto |** **manual]	port** *<1-65535>* **|** **response-delay** *<1-999>* **|** **[signals cts always-high |** **represent-ri]	dcd always-high** **| follow-connection]	[style** **numeric	verbose]	success-** **string** *<WORD>* **| suppress off** **| on}**	**echo**—Configure echoes to have the terminal echo back typed characters. (equivalent to ATE0/ATE1 commands). Disabled by default **failure String**—Configure the string sent to the serial device when a connection fails. If no string is entered, the string NO CARRIER is sent. **host**—Configure the target host name. **init-string**—Configure additional vmodem commands that affects how vmodem starts. The following commands are supported: ATQn, ATVn, ATEn, ATS0, AT&Z1, AT&Sn, AT&Rn, AT&Cn, AT&F, ATS2, ATS12, and ATDS1.

See *VModem Initialization Commands* in the *Router's User's Guide* for a more detailed explanation of the supported initialization commands.

mode—Configure auto mode to establish the connection when the line becomes active. You must supply the AT command or phone number to start the connection.

port—Configure the port number the target host is listening on for messages.

response-delay—The amount of time, in milliseconds, before an AT response is sent to the requesting device. The default is 250 ms.

signals dcd
Controls the state of the DCD signal.

- always-high—DCD signal always stays high
- follow-connection— DCD signal is high when an end to end connection is established and low when it is not

Since the router does not have a physical DCD pin, you need to re-map the DTR or RTS signal to DCD to have the signal present. (see next option).

signals dtr—You can specify how the DTR signal pin acts during your modem application
connection, as itself (DTR), as DCD, or as RI.

signals rts—You can specify how the RTS signal pin acts during your modem application connection, as itself (RTS), as DCD, or as RI.

style
One of the following:

- **Verbose**—Return codes (strings) are sent to the connected device.
- **Numeric**—The following characters are sent to the connected device:
- **0** OK
- 1 CONNECTED

- **2** RING
- **3** NO CARRIER
- **4** ERROR
- **6** INTERFACE DOWN
- **7** CONNECTION REFUSED
- 8 NO LISTENER

success-string
String that is sent to the serial device when a connection succeeds. If no string is entered, then the string CONNECT is sent with the connecting speed. For example CONNECT 9600

- **suppress**
  When enabled, the connection success/failure indication strings are sent to the connected device, otherwise, these indications are suppressed.
  The default is Disabled

Command Modes	Perle(config-line)#

Usage Guidelines

Use this command to configure line tty parameters.

Examples

This example disables CLI mode for tty 2.

Perle(config)#tty 2 mode disable

(config-line)#vty

{**accounting exec** *<WORD>* | **default** | **authorization exec** *<WORD>* | **default** | | **exec-timeout** *<0-35791>* *<0-2147483>* | **history size** *0-256>* | **length** *0-512>* | **login** *<WORD>* **default** | **width** *<0-512>*}

Use the no form of this command to negate a command or set to defaults.

Syntax Description	(config-line)#vty
accounting exec *<WORD>* | **default** |	Configure accounting parameters.
authorization exec *<WORD>* | **default**] |	Configure authorization parameters.

exec-timeout *<0-35791> <0-2147483>* |	Configure the time in minutes and seconds for CLI to timeout on the vty session.
history size *<0-256>* |	Configure the size of the history buffer.
length *<0-512>* |	Configure the number of lines displayed on the screen. Type 0 for no pausing at end of page.
login *<WORD>* **default** |	Configure login authentication parameters.
width *<0-512>*}	Configure terminal screen width.
Command Modes	Perle>enable
	Perle>config
	Perle(config)#line vty
	Perle(config-line)#

Usage Guidelines

Configure vty line parameters.

Examples

Configure the terminal width to 132.

Perleconfig)#line vty
Perle(config-line)#width 132
