

This guide covers basic installation and configuration and is intended for first time setup or product evaluation.

Complete details can be found in the following guides at www.perle.com/downloads.

- IDS-409G Hardware Installation Guide
- IDS Managed Switches User Guide
- IDS Managed Switches CLI Guide

What's in the box?

- The IDS switch
- Quick Start Guide (this document)

Hardware Overview

Note: Type of fiber may vary by model

* 1-3 Fiber ports and 6-8 Ethernet ports depending on the specific model

Wiring the Terminal Block

Connecting the switch to ground (optional)

If your installation requires additional grounding, refer to the Hardware Installation Guide for information on connecting ground.

Connecting power to the switch

You may connect both sets of power inputs to provide redundant power.

1. Ensure the power source is off prior to connection.
2. Using a pair of 12-20AWG wires, strip them both 7-8mm (5/16”).
3. Loosen the terminal block screws and connect positive (+) / negative (-) wires in the +/- terminals.
4. Tighten terminal screws (0.51Nm torque). Ensure the wires are securely fastened.
5. Re-insert the terminal block connector if removed. Turn power on at source. Check LED indicators for status.
6. Connect P2 (power source 2, beginning at Step 1).

For complete wiring instructions and for all Hazardous Locations and general safety warnings consult the Hardware Installation Guide.

Connecting a fiber device

Connect the network or device to the fiber ports using cable with matching connector types.

Connecting Ethernet

Connect network or devices to Ethernet ports using Cat5/5e Ethernet cables

LED Indicators

(For detailed information refer to the Hardware Installation Guide)

PWR (Power Inputs)

- **Green**—P1 and P2 Power inputs are within specifications
- **Orange**—P1 or P2 not providing power within specifications
- **Red**—Neither P1 or P2 providing power within specifications

SYS (System status)

- **Green blinking**—System booting
- **Green solid**—System operating normally
- **Green blinking fast**—Fast Setup mode activated
- **Red**—Hardware fault or firmware load error.

Ethernet Port Link / Speed (Green and Yellow LEDs)

- **1000 Mbps** Green on, Yellow off
- **100 Mbps** Green on, Yellow on
- **10 Mbps** Green off, Yellow on

Note: Blinking indicates activity

Fiber Port Link/Activity)

- **Green solid** – Fiber link
- **Green blinking** – Fiber link and port activity

Note: Fiber Link/Activity LED numbers match the Fiber Port numbers.

Note: Alr (Alarm), BC (Backup Coupling), RM (Ring Master) see Hardware Installation Guide

Fast Setup

Fast Setup provides a simple method of doing an initial setup from a PC. It only requires a PC Ethernet connection and a web browser. Other methods to configure the IDS Switch can be found in the IDS Switch User’s guide.

1. Your PC must be set to obtain an IP address automatically using DHCP (See Control Panel ->Network and Sharing Center -> Change adapter settings ->Local Area Connection Properties ->Internet Protocol Version (TCP/IPv4) ->Properties ->Select Obtain an IP address automatically.
2. Press and hold the reset button (9) on the switch for 4 seconds and then release it. Since the reset button is recessed in the switch, a small tool such as a paper clip will be required. The yellow and green LEDs on an unused RJ-45 connector will flash rapidly to indicate where to plug in the Ethernet cable from your PC.
3. Using a web browser, enter to a well known webpage such as www.google.com, you will be automatically directed to the IDS Get Started screen.

Note: While in Fast setup mode the IDS switch will use an IP address of 169.254.0.1. If step 3 fails to direct the browser properly, then enter the switch’s IP address into the browser’s address bar.

4. Once connected, fill in the required fields, apply changes to save and exit. The configuration changes will be immediately applied to the switch.
5. The PC can now be reset to its normal network address and the switch can be accessed using the conventional IP addressing.
